XX  
XX Detecting Mycobacterium species, involves in vitro amplification of 16S  
PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using  
PT specific primers, and detecting the amplified nucleic acid.  
XX  
XX Claim 1; Page 36; 44pp; English.  
XX  
XX The invention relates to a method of detecting Mycobacterium species,  
CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA  
CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture  
CC comprising a polymerase, and at least two primers, and then detecting the  
CC amplified nucleic acid. The method is relatively simple and useful for  
CC detecting the presence of various Mycobacterium species in a biological  
CC sample, and thus important for diagnosis of infections resulting from  
CC them. The method is especially important for screening opportunistic  
CC infections caused by M. tuberculosis or a Mycobacterium other than  
CC tuberculosis (MOTT). The present sequence is a PCR primer used for  
CC amplifying Mycobacterium 16S rRNA

XX This sequence represents a target sequence for mycobacterial probes. This

XX sequence represents a precursor RNA fragment that is released during the

XX method of the invention. The method is for the determination of

XX mycobacterial cell sensitivity to an antimicrobial agent, and comprises:

XX (a) culturing the cells in the presence of the antimicrobial agent; (b)

XX treating the cells by enzymatic or mechanical means to expose the cell

XX membrane to lysis reagents, and contacting the cells with a lysis reagent

XX under conditions such that pre-rRNA is released from the cells but not

XX degraded; and (c) detecting the pre-rRNA with an oligonucleotide probe

XX capable of hybridizing to a region of the pre-rRNA that is not present in

XX mature mycobacterial RNA, where sensitivity to the antimicrobial agent

XX is indicated by an increase or decrease in pre-rRNA levels for cells

XX exposed to the antimicrobial agent compared with mycobacterial cells not

XX exposed to the antimicrobial agent. The lysis method, unlike known

XX methods, results in detectable levels of pre-rRNA

XX Assay for pre-ribosomal RNA in mycobacterium cells - by hybridisation

XX with specific probes after cell lysis.

XX Disclosure; Col 18; 54pp; English.

XX The present sequence represents a mycobacterial mature ribosomal RNA

XX target sequence. The present invention describes a method for detecting

XX pre-rRNA in cells of a mycobacterial sample. The method comprises: (a)

XX treating the cells to release pre-rRNA by: (i) pretreating the cells by

XX enzymatic degradation using both lysozyme and protease until their cell

XX walls are rendered porous to expose their cell membranes, making the

XX cells susceptible to lysis; (ii) contacting the pretreated cells with a

XX combination of a magnesium chelator, a nonionic detergent and an anionic

XX detergent; and (iii) heating the cells to 75-99 degrees Celsius until the

XX mycobacterial cells are lysed; and (b) detecting the pre-rRNA using at

XX least one oligonucleotide probe which is capable of selectively

XX hybridizing to a region of the pre-rRNA that is not present in a mature

XX mycobacterial rRNA. The probes can be used to identify many Mycobacterium

XX spp. including M. tuberculosis, M. leprae, M. habana, M. avium, M. bovis,

XX M. lufu, M. paratuberculosis, M. marinum, M. simiae and/or M.

XX intracellulare. The probes may also be used to measure mycobacterial

XX response to inhibitors of RNA and protein synthesis and may therefore be

XX used to screen new antimycobacterial drugs. Mycobacteria have a slow

XX growth rate. By using the probes, drug developers can now identify

XX compounds that are more effective, but less stable than those previously

XX identified

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 1; Page 37; 44pp; English.  
Detecting Mycobacterium species, involves in vitro amplification of 16S rRNA or DNA encoding RNA in nucleic acid amplification mixture using specific primers, and detecting the amplified nucleic acid.  
The invention relates to a method of detecting Mycobacterium species, that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA encoding 16S rRNA in an in vitro nucleic acid amplification mixture comprising a polymerase, and at least two primers, and then detecting the amplified nucleic acid. The method is relatively simple and useful for detecting the presence of various Mycobacterium species in a biological sample, and thus important for diagnosis of infections resulting from them. The method is especially important for screening opportunistic infections caused by M. tuberculosis or a Mycobacterium other than tuberculosis (MOTT). The present sequence is a PCR primer used for amplifying Mycobacterium 16S rRNA

PT Diagnosing and analyzing autoimmune disease using gene expression  
 PT profiles and microarray technology, useful for diagnosing and treating  
 PT rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and  
 PT gout.

XX Disclosure; Page; 56pp; English.

XX The invention relates to a novel method for diagnosing and analysing  
 CC autoimmune disease or arthritides. The method comprises obtaining a  
 CC patient sample containing mRNA, analysing gene expression using the mRNA  
 CC that results in a gene expression signature of the mRNA, and using that  
 CC gene expression signature to diagnose or analyse the autoimmune disease  
 CC or arthritides in the patient, where gene expression of at least 60% of  
 CC the genes correlates with that of the gene signature. The invention  
 CC further comprises: a treatment of rheumatoid arthritis; identification of  
 CC genes for targeting in the treatment of rheumatoid arthritis in a mammal  
 CC other than a mouse; diagnosis of rheumatoid arthritis in a mammal; an  
 CC array or gene chip, specific for rheumatoid arthritis; diagnosis or  
 CC analyses of autoimmune disease or rheumatoid arthritis; screening the  
 CC efficacy of a candidate drug in vitro for the treatment of collagen-  
 CC induced arthritis; and reducing the symptoms associated with collagen-  
 CC induced arthritis. The compositions of the invention have the following

CC activities: immunosuppressive, antirheumatic, antiarthritis, osteopathic,  
 CC antigout, antiinflammatory, dermatological, and immunomodulatory. The  
 CC methods and compositions of the present invention are useful for  
 CC diagnosing and treating autoimmune disease or arthritides, such as  
 CC rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis,  
 CC fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an  
 CC immune disease caused by an infectious agent. This polynucleotide  
 CC represents a DNA sequence relating to the genes used in the analysis and  
 CC treatment of autoimmune diseases or arthritides. Note: This sequence is  
 CC not shown in the specification. It has been supplied in an electronic  
 CC format from WIPO.

PS Claim 1; SEQ ID NO 8901; 658pp; English.  
 XX  
 CC The invention relates to a single exon nucleic acid probe (SENP) (I) for  
 CC measuring human gene expression in a sample derived from human adult  
 CC liver, comprising one of 13109 defined nucleotide sequences given in the  
 CC specification (or complements/ fragments). The probe hybridises at high  
 CC stringency to a nucleic acid molecule expressed in the human adult liver.  
 CC (I) may be used for predicting, measuring and displaying gene expression  
 CC in samples derived from human adult liver. The genes identified may be  
 CC involved in genetic liver diseases such as cirrhosis,  
 CC hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is  
 CC associated with coronary heart disease. ABS25011-ABS51005 represent human  
 CC liver single exon nucleic acid probes of the invention. Note: The  
 CC sequence information for this patent does not appear in the printed  
 CC specification but was obtained in electronic format directly from WIPO at

 PT measure gene expression in human lung samples.  
 PT  
 XX

PS Claim 1; SEQ ID NO 8871; 634pp; English.

XX The invention relates to a spatially-addressable set of single exon

CC nucleic acid probes for measuring gene expression in a sample derived

CC from human lung comprising single exon nucleic acid probes having one of

CC 12614 nucleic acid sequences mentioned in the specification, or their

CC complements or the 12387 open reading frames derived from the 12614

CC probes. Also included are a microarray comprising the novel set of probes

CC; the novel set of probes which hybridise at high stringency to a nucleic

CC acid expressed in the human lung; measuring gene expression in a sample

CC derived from human lung, comprising (a) contacting the array with a

CC collection of detectably labeled nucleic acids derived from human lung

CC mRNA, and (b) measuring the label detectably bound to each probe of the

CC array; identifying exons in a eukaryotic genome, comprising (a)

CC algorithmically predicting at least one exon from genomic sequences of

CC the eukaryote; and (b) detecting specific hybridisation of detectably

CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,

CC having a fragment identical to the predicted exon, the probe is included

CC in the above mentioned microarray; assigning exons to a single gene,

CC comprising (a) identifying exons from genomic sequence by the method

CC above and (b) measuring the expression of each of the exons in several

CC microarrays having a probe with the exon, where a common pattern of

CC expression of the exons in the tissues and/or cell types indicates that

CC the exons should be assigned to a single gene; a peptide comprising one

CC of 12011 sequences, mentioned in the specification, or encoded by the

CC probes/open reading frames (ORF). The probes are used for gene expression

CC analysis, and for identifying exons in a gene, particularly using human

CC lung derived mRNA and for the study of lung diseases such as asthma, lung

CC cancer, chronic obstructive pulmonary disease (COPD), interstitial lung

CC disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,

CC tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-

CC Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary

CC histiocytosis, lymphangioleiomyomatosis, pulmonary alveolar proteinosis,

CC Karagenes syndrome, fibrocystic pulmonary dysplasia, primary ciliary

CC dyskinesia, pulmonary hypertension and hyaline membrane disease. The

CC present sequence is a single exon probe of the invention. Note: The

CC sequence data for this patent did not form part of the printed

CC specification, but was obtained in electronic format directly from WIPO

CC at ftp.wipo.int/pub/published\_pct\_sequences

XX

CC The invention relates to an isolated nucleic acid comprising any one of

CC the 6213 antisense sequences given in the specification where expression

CC of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid

CC encoding a polypeptide whose expression is inhibited by the antisense

CC nucleic acid; (2) a host cell containing the vector; (3) an isolated

CC antisense nucleic acid; (4) an antibody capable of specifically binding

CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

CC proliferation or the activity of a gene in an operon required for

CC proliferation; (7) identifying a compound that influences the activity of

CC the gene product or that has an activity against a biological pathway

CC required for proliferation, or that inhibits cellular proliferation; (8)

CC identifying a gene required for cellular proliferation or the biological

CC pathway in which a proliferation-required gene or its gene product lies

CC or a gene on which the test compound that inhibits proliferation of an

CC organism acts; (9) manufacturing an antibiotic; (10) profiling a

CC compound's activity; (11) a culture comprising strains in which the gene

CC product is overexpressed or underexpressed; (12) determining the extent

CC to which each of the strains is present in a culture or collection of

CC strains; or (13) identifying the target of a compound that inhibits the

CC proliferation of an organism. The antisense nucleic acids are useful for

CC identifying proteins or screening for homologous nucleic acids required

CC for cellular proliferation to isolate candidate molecules for rational

CC drug discovery programs, or for screening homologous nucleic acids

CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,

CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is one of the target

CC prokaryotic essential genes. Note: The sequence data for this patent did

CC not form part of the printed specification, but was obtained in

CC electronic format directly from WIPO at

CC ftp.wipo.int/pub/published\_pct\_sequences

 XX New recombinant nucleic acid encoding carcinoma associated protein,  
 PT useful for preparing compositions for treating carcinomas.  
 PT  
 XX Claim 1; SEQ ID NO 1058; 245pp; English.  
 PS  
 XX The invention relates to recombinant carcinoma associated (CA) nucleic  
 CC acid sequences from mouse and human (ADA01482-ADA03094), and to  
 CC recombinant carcinoma associated proteins (CAP) encoded by them. The  
 CC invention also encompasses expression vectors and host cells comprising a  
 CC CA nucleic acid, a polypeptide (especially an antibody) that specifically  
 CC binds to the protein, and a biochip comprising CA nucleic acid or  
 CC fragments thereof. The sequences of the invention were identified using  
 CC oncogenic retroviruses, which insert into the genome of the host organism  
 CC at random. Many of these do not carry transduced host oncogenes or  
 CC pathogenic trans-acting viral genes, meaning that cancer incidence is a  
 CC direct consequence of the effects of proviral integration into host  
 CC protooncogenes. The CA nucleic acid sequences can be used to diagnose  
 CC carcinoma (especially breast cancer, prostate cancer, lymphoma or  
 CC leukaemia) or a propensity to carcinoma by determination of the sequence  
 CC of a CA gene, or by determination of CA gene expression in particular  
 CC tissues. CA nucleic acids, proteins and antibodies are also useful as  
 CC therapeutic agents and in screening and evaluating drug candidates. The  
 CC present sequence represents a specifically claimed human CA nucleic acid  
 CC sequence of the invention. Note: The complete sequence data for this  
 CC patent did not form part of the printed specification, but was obtained  
 CC in electronic format directly from WIPO at  
 CC ftp.wipo.int/pub/published\_pct\_sequences.

XX  
XX The invention relates to Pseudomonas aeruginosa polypeptides and the  
CC polynucleotides encoding them. The sequences are useful in diagnosis and  
CC therapy of pathological conditions, as molecular targets for diagnostics,  
CC prophylaxis and treatment of pathological conditions resulting from a  
CC bacterial infection, for evaluating a compound, such as a polypeptide,  
CC for the ability to bind a P. aeruginosa nucleic acid, as components of  
CC effective antibacterial targets, as targets for antibacterial drugs,  
CC including anti-P. aeruginosa drugs, as templates for recombinant  
CC production of P. aeruginosa-derived peptides or polypeptides, as target  
CC components for diagnosis and/or treatment of P. aeruginosa-caused  
CC infection, and in detection of P. aeruginosa sequences or other sequences  
CC of Pseudomonas species using biochip technology. Sequences ABD01397-  
CC ABD17967 represent P. aeruginosa polynucleotides of the invention. Note:

 PT New isolated nucleic acid molecule that encodes a plant protein or its  
 PT fragment, useful for isolating a variety of agronomically significant  
 PT genes associated with plant growth, quality or yield, and as molecular  
 PT tags to map genes.  
 XX  
 PS Claim 1; SEQ ID NO 8399; 34pp; English.  
 XX  
 CC The invention relates to 17880 cotton expressed sequence tags (ESTs;  
 CC ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated  
 CC from primed or non-primed seeds from variety DP50B, mature seeds from  
 CC variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium  
 CC tissue, developing fibres, carpel walls and septa from variety  
 CC Nucotton33B. The invention also relates to substantially purified  
 CC proteins or their fragments encoded by nucleic acid molecules of the  
 CC invention, and to transformed plants having a nucleic acid construct  
 CC comprising a nucleic acid of the invention. The cotton ESTs are useful as  
 CC molecular tags to isolate genetic regions, to isolate genes, to map  
 CC genes, to determine gene function and to determining whether genes are  
 CC members of a particular gene family. The nucleic acid molecules may be  
 CC used for isolating a variety of agronomically significant genes  
 CC associated with plant growth, quality, yield, and could also serve as  
 CC links in metabolic and catabolic pathways. The nucleic acid molecules are  
 CC also useful for identifying genes important in initiating and maintaining  
 CC seed germination or that may be used to mitigate stresses encountered  
 CC during seed germination. The ESTs additionally enable the acquisition of  
 CC promoters and cis-regulatory elements which will be useful to express  
 CC agronomically significant genes in these tissues and/or other tissues,  
 CC and also permits the acquisition of molecular markers useful in breeding  
 CC schemes, genetic and molecular mapping, and in cloning of agronomically  
 CC significant genes. The nucleic acid molecules are further useful for  
 CC detecting the expression level or pattern of a protein or mRNA and for  
 CC detecting the presence or quantity of a protein by tissue printing. The  
 CC present sequence represents a specifically claimed EST isolated from a

CC cotton variety Nucotton33B androecium tissue cDNA library (LIB3828). The  
 CC sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from the US  
 CC patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340

 XX  
 CC The invention relates to an isolated nucleic acid comprising any one of  
 CC the 6213 antisense sequences given in the specification where expression  
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:  
 CC (1) a vector comprising a promoter operably linked to the nucleic acid  
 CC encoding a polypeptide whose expression is inhibited by the antisense  
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated  
 CC polypeptide or its fragment whose expression is inhibited by the  
 CC antisense nucleic acid; (4) an antibody capable of specifically binding  
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular  
 CC proliferation or the activity of a gene in an operon required for  
 CC proliferation; (7) identifying a compound that influences the activity of  
 CC the gene product or that has an activity against a biological pathway  
 CC required for proliferation, or that inhibits cellular proliferation; (8)  
 CC identifying a gene required for cellular proliferation or the biological  
 CC pathway in which a proliferation-required gene or its gene product lies  
 CC or a gene on which the test compound that inhibits proliferation of an

CC organism acts; (9) manufacturing an antibiotic; (10) profiling a  
CC compound's activity; (11) a culture comprising strains in which the gene  
CC product is overexpressed or underexpressed; (12) determining the extent  
CC to which each of the strains is present in a culture or collection of  
CC strains; or (13) identifying the target of a compound that inhibits the  
CC proliferation of an organism. The antisense nucleic acids are useful for  
CC identifying proteins or screening for homologous nucleic acids required  
CC for cellular proliferation to isolate candidate molecules for rational  
CC drug discovery programs, or for screening homologous nucleic acids  
CC K. pneumoniae or P. aeruginosa. The present sequence is one of the target  
CC prokaryotic essential genes. Note: The sequence data for this patent did  
CC not form part of the printed specification, but was obtained in  
CC electronic format directly from WIPO at

XX  
XX Novel human cancer associated protein encoded within open reading frame  
PT of cancer associated gene, useful as targets for diagnosing cancer.  
PS  
XX Disclosure; SEQ ID NO 115; 182pp; English.  
XX  
XX The invention relates to cancer-associated proteins (CAP) and the cancer-  
CC associated (CA) nucleic acids encoding them. The invention also relates  
CC to a method for treating cancers involving administering to a patient an  
CC inhibitor of CAP, and a method of screening for anticancer activity in a  
CC potential drug involving providing a cell that expresses a CA gene,  
CC contacting a tissue sample derived from a cancer cell with an anticancer  
CC drug candidate and monitoring the effect of the anticancer drug candidate  
CC on expression of the CA gene. The CAP proteins are useful for detecting  
CC cancer associated with expression of a CAP protein in a test cell sample  
CC and for screening for a bioactive agent capable of modulating the  
CC activity of a CAP protein. The CA nucleic acids are useful for diagnosing  
CC cancer, involving determining the expression of a CA nucleic acid in a  
CC tissue. This sequence represents a murine CA gene of the invention. Note:  
CC The sequence data for this patent did not form part of the printed  
CC specification, but was obtained in electronic format directly from WIPO  
CC at ftp.wipo.int/pub/published\_pct\_sequences

XX

CC AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon  
 CC cancer-associated nucleic acid molecules (N) and proteins (P), where the  
 CC proteins are collectively known as colon cancer antigens. The colon  
 CC cancer antigens have cytostatic activity and can be used in gene therapy  
 CC and vaccine production. N and P may be used in the prevention, diagnosis  
 CC and treatment of diseases associated with inappropriate P expression. For  
 CC example, N and P may be used to treat disorders associated with decreased  
 CC expression by rectifying mutations or deletions in a patient's genome  
 CC that affect the activity of P by expressing inactive proteins or to  
 CC supplement the patient's own production of P. Additionally, N may be used  
 CC to produce the colon cancer-associated Ps, by inserting the nucleic acids  
 CC into a host cell and culturing the cell to express the proteins. N and P  
 CC can be used in the prevention, diagnosis and treatment of colorectal  
 CC carcinomas and cancers. AAH37196 to AAH37204 and AAG77789 represent  
 CC sequences used in the exemplification of the present invention. N.B.  
 CC Pages 666 to 682 and page 7053 of the sequence listing were missing at  
 CC time of publication, meaning no sequences are present for SEQ ID NO:1027  
 CC to 1052, 7921 and 7922

 XX New isolated nucleic acid molecule that encodes a plant protein or its  
 PT fragment, useful for isolating a variety of agronomically significant  
 PT genes associated with plant growth, quality or yield, and as molecular  
 PT tags to map genes.  
 XX Claim 1; SEQ ID NO 2667; 34pp; English.  
 PS  
 XX The invention relates to 17880 cotton expressed sequence tags (ESTs;  
 CC ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated

CC from primed or non-primed seeds from variety DP50B, mature seeds from  
 CC variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium  
 CC tissue, developing fibres, carpel wallis and septa from variety  
 CC Nuctoton3B. The invention also relates to substantially purified  
 CC proteins or their fragments encoded by nucleic acid molecules of the  
 CC invention, and to transformed plants having a nucleic acid construct  
 CC comprising a nucleic acid of the invention. The cotton ESTs are useful as  
 CC molecular tags to isolate genetic regions, to isolate genes, to map  
 CC genes, to determine gene function and to determining whether genes are  
 CC members of a particular gene family. The nucleic acid molecules may be  
 CC used for isolating a variety of agronomically significant genes  
 CC associated with plant growth, quality, yield, and could also serve as  
 CC links in metabolic and catabolic pathways. The nucleic acid molecules are  
 CC also useful for identifying genes important in initiating and maintaining  
 CC seed germination or that may be used to mitigate stresses encountered of  
 CC during seed germination. The ESTs additionally enable the acquisition of  
 CC promoters and cis-regulatory elements which will be useful to express  
 CC agronomically significant genes in these tissues and/or other tissues,  
 CC and also permits the acquisition of molecular markers useful in breeding  
 CC schemes, genetic and molecular mapping, and in cloning of agronomically  
 CC significant genes. The nucleic acid molecules are further useful for  
 CC detecting the expression level or pattern of a protein or mRNA and for  
 CC detecting the presence or quantity of a protein by tissue printing. The  
 CC present sequence represents a specifically claimed EST isolated from a  
 CC cotton variety DP50B primed seed cDNA library (LTB3825). The sequence  
 CC data for this patent did not form part of the printed specification, but  
 CC was obtained in electronic format directly from the US patent office at  
 CC seqdata.uspto.gov/sequence.html?DocId=US20040123340

XX PT New polynucleotides which encode polypeptides involved in olfactory
XX PT sensation for identifying olfactory agonists and antagonists.
XX PS Claim 1; Fig 2; 1857pp; English.
XX CC The present sequence is one of a number of isolated polynucleotides which
XX CC encode polypeptides involved in olfactory sensation. The polynucleotides
XX CC can be used in screening for olfactory agonists and antagonists. The
XX CC methods allow for the determination of primary scents and the
XX CC identification of the odour receptors used to detect these primary
XX CC scents. The methods also enable determination of secondary scents and the
XX CC identification of combinations of odour receptors that are involved in
XX CC detecting such secondary scents. This enables the construction of a scent
XX CC representation (also called a scent fingerprint or scent profile), which
XX CC may be used to re-create and edit scents. Libraries of olfactory
XX CC receptors are useful for determining the interaction pattern of a
XX CC composition with the receptors, and can be used for determining
XX CC differences in the olfactory faculties of different individuals

XX PS Claim 1; SEQ ID NO 52; 35pp; Japanese.
XX CC The invention relates to a novel protein concerned in biosynthesis of an
XX CC isoquinoline alkaloid. The protein has a fully defined sequence of 351 or
XX CC 352 amino acids as given in the specification, or a sequence in which one
XX CC or more amino acids are deleted, added, or substituted in the protein,
XX CC and having columbamine 7-O-methyltransferase, and nor coclaurine
XX CC synthetase activity. The protein and a transformed host are useful for
XX CC producing isoquinoline alkaloid. The isoquinoline alkaloid biosynthesis
XX CC protein encoding polynucleotide and cDNA library are useful for isolating
XX CC a full length gene concerned in biosynthesis of an isoquinoline alkaloid.
XX CC The alkaloid biosynthesis protein encoding polynucleotide is useful as a
XX CC probe for isolating a full length gene concerned in biosynthesis of an
XX CC isoquinoline alkaloid which is useful as a pharmaceutical raw material.
XX CC This polynucleotide sequence represents the DNA of an expressed sequence
XX CC tag relating to the isoquinoline alkaloid biosynthesis protein of the
XX CC invention.

 PT acid sequences in sample by in situ hybridization useful for detection of  
 PT acquired or inherited genetic diseases.  
 XX  
 PS Example 1; SEQ ID NO 342; 30pp; English.  
 XX  
 CC The invention relates to a nucleic acid hybridisation probe comprising a  
 CC labelled, single copy nucleic acids of at least 50 nucleotides, which  
 CC will hybridise to a deduced single copy sequence interval in target  
 CC nucleic acid (TNA) of known sequence. The single copy sequence is deduced  
 CC by comparing the target nucleic acid (e.g. a disease causing gene) with a  
 CC collection of high and low complexity repeat sequences as found in the  
 CC genome of the organism from containing the target nucleic acid. The probe  
 CC is generated by PCR on the target sequence. The probe is essentially free  
 CC of blocking nucleic acid sequences which will hybridise to repeat  
 CC sequences within the genome of which the TNA is a part, and is labelled  
 CC with a label selected from fluorochrome-responsive labels, fluorochromes,  
 CC calorimetric chemical, conjugated proteins, antibodies, antigens and  
 CC their mixtures. The probe is useful in a hybridisation method, where the  
 CC hybridisation method is from in situ hybridisation, Southern blot, and  
 CC other methods in which nucleic acid is immobilised, where the method  
 CC further comprises selecting a single copy nucleic acid which will  
 CC hybridise to a duplicon or triplicon sequence domain. The probe is useful  
 CC for determining the existence of previously unknown repeat sequence

will hybridize to a deduced single copy sequence interval in target nucleic acid (TNA) of known sequence. (I) is useful in a hybridization method which comprises preparing a reaction mixture comprising TNA and (I) which hybridizes to TNA, and causing (I) to hybridize to TNA, where the hybridization method is from in situ hybridization, Southern blot, and other methods in which nucleic acid is immobilized, where the method further comprises selecting a single copy nucleic acid which will hybridize to a duplcon or triplicon sequence domain. (I) is useful for determining the existence of previously unknown repeat sequence families in a genome; determining a chromosome breakpoint and in the fields of cytogenetics and molecular genetics for determining the presence of specific nucleic acid sequences in a sample of eukaryotic origin, e.g. the probes may be used to analyze specific chromosomal locations by in situ hybridization as a detection of acquired or inherited genetic diseases especially for detection of genetic or neoplastic disorders. Unlike prior art techniques, (I) permits more precise chromosomal breakpoint determinations by in situ hybridization. Hybridization techniques utilizing (I), have made it possible to obtain reliable, easily detectable signals with relatively small probes. A readily detectable signal was obtained with a probe on the order of 2 kb in length, using fluorescent in situ hybridization (FISH) technology. This sensitivity of (I) is improved compared to the prior art, because the probes of (I) are homogeneous single copy sequences. However, smaller amplified segments, each comprising non-repetitive sequences, may also be used in combination as probes to achieve adequate signals for in situ hybridization. Complex single copy probes that hybridize to duplicated or triplicated targets can also increase hybridization signals. This sequence represents a human HIRA genomic sequence that shows homology to a known high-complexity repeat sequence family of the human genome and is used in the creation of an HIRA gene probe.

XX Human genome-derived single exon nucleic acid probes useful for analyzing
PT gene expression in human cervical epithelial cells.
XX Claim 25; SEQ ID NO 13277; 487pp; English.
XX The present invention relates to human single exon nucleic acid probes
CC (SENP). The present sequence is one such probe. The SENPs are derived
CC from human HeLa cells. The SENPs can be used to produce a single exon
CC microarray, which can be used for measuring human gene expression in a
CC sample derived from human cervical epithelial cells. By measuring gene
CC expression, the probes are therefore useful in grading and/or staging of
CC diseases of the cervix, notably cervical cancer. Note: The sequence data
CC for this patent did not form part of the printed specification, but was
CC obtained in electronic format directly from WIPO at

XX PT New spatially-addressable set of single exon nucleic acid probes, useful
XX PT for measuring gene expression in sample derived from human breast,
XX PT comprises number of single exon nucleic acid probes.
XX PS Claim 4; SEQ ID NO 9197; 327pp + Sequence Listing; English.
XX CC The invention relates to a spatially-addressable set of single exon
XX CC nucleic acid probes for measuring gene expression in a sample derived
XX CC from human breast and Bt 474 cells. The method involves contacting the
XX CC probes with a collection of detectably labelled nucleic acids derived
XX CC from mRNA of human breast, and then measuring the label bound to each
XX CC probe of the microarray. The probes are useful for verifying the
XX CC expression of regions of genomic DNA predicted to encode proteins. They
XX CC are useful for gene discovery, and for determining predisposition and/or
XX CC prognosing breast disease. Gene expression analysis is useful for
XX CC assessing the toxicity of chemical agents on cells. The microarray of
XX CC this invention presents a far greater diversity of probes for measuring
XX CC gene expression, with far less bias than expressed sequence tag
XX CC microarrays. The method is suitable for rapid production of functional
XX CC information from genomic sequence. The present sequence is a single exon
XX CC nucleic acid probe of the invention. Note: The sequence data for this
XX CC patent did not form part of the printed specification, but was obtained
XX CC in electronic format directly from WIPO at

XX PT New spatially-addressable set of single exon nucleic acid probes, useful
XX PT for measuring gene expression in sample derived from human breast,
XX PT comprises number of single exon nucleic acid probes.
XX PS Claim 4; SEQ ID NO 9197; 327pp + Sequence Listing; English.
XX CC The invention relates to a spatially-addressable set of single exon
XX CC nucleic acid probes for measuring gene expression in a sample derived
XX CC from human breast and Bt 474 cells. The method involves contacting the
XX CC probes with a collection of detectably labelled nucleic acids derived
XX CC from mRNA of human breast, and then measuring the label bound to each
XX CC probe of the microarray. The probes are useful for verifying the
XX CC expression of regions of genomic DNA predicted to encode proteins. They
XX CC are useful for gene discovery, and for determining predisposition and/or
XX CC prognosing breast disease. Gene expression analysis is useful for
XX CC assessing the toxicity of chemical agents on cells. The microarray of
XX CC this invention presents a far greater diversity of probes for measuring
XX CC gene expression, with far less bias than expressed sequence tag
XX CC microarrays. The method is suitable for rapid production of functional
XX CC information from genomic sequence. The present sequence is a single exon
XX CC nucleic acid probe of the invention. Note: The sequence data for this
XX CC patent did not form part of the printed specification, but was obtained
XX CC in electronic format directly from WIPO at
XX CC ftp.wipo.int/pub/published_pct_sequences

XX Human genome-derived single exon nucleic acid probes useful for analyzing  
 XX gene expression in human adult liver.  
 PT

XX Claim 4; SEQ ID NO 17199; 658pp; English.

XX The invention relates to a single exon nucleic acid probe (SENP) (I) for

XX measuring human gene expression in a sample derived from human adult

XX liver, comprising one of 13109 defined nucleotide sequences given in the

XX specification (or complements/ fragments). The probe hybridises at high

XX stringency to a nucleic acid molecule expressed in the human adult liver.

XX (I) may be used for predicting, measuring and displaying gene expression

XX in samples derived from human adult liver. The genes identified may be

XX involved in genetic liver diseases such as cirrhosis,

XX hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is

XX associated with coronary heart disease. ABS25011-ABS51005 represent human

XX liver single exon nucleic acid probes of the invention. Note: The

XX sequence information for this patent does not appear in the printed

XX specification but was obtained in electronic format directly from WIPO at

XX ftp.wipo.int/pub/published\_pct\_sequences

XX

XX Spatially-addressable set of single exon nucleic acid probes, used to

XX measure gene expression in human lung samples.

XX

XX Claim 4; SEQ ID NO 16637; 634pp; English.

XX

XX The invention relates to a spatially-addressable set of single exon

XX nucleic acid probes for measuring gene expression in a sample derived

XX from human lung comprising single exon nucleic acid probes having one of

XX 12614 nucleic acid sequences mentioned in the specification, or their

XX complements or the 12387 open reading frames derived from the 12614

XX probes. Also included are a microarray comprising the novel set of probes

CC ; the novel set of probes which hybridise at high stringency to a nucleic  
CC acid expressed in the human lung; measuring gene expression in a sample  
CC derived from human lung, comprising (a) contacting the array with a  
CC collection of detectably labeled nucleic acids derived from human lung  
CC mRNA, and (b) measuring the label detectably bound to each probe of the  
CC array; identifying exons in a eukaryotic genome, comprising (a)  
CC algorithmically predicting at least one exon from genomic sequences of  
CC the eukaryote; and (b) detecting specific hybridisation of detectably  
CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,  
CC having a fragment identical to the predicted exon, the probe is included  
CC in the above mentioned microarray; assigning exons to a single gene,  
CC comprising (a) identifying exons from genomic sequence by the method  
CC above and (b) measuring the expression of each of the exons in several  
CC tissues and/or cell types using hybridisation to a single exon  
CC microarrays having a probe with the exon, where a common pattern of  
CC expression of the exons in the tissues and/or cell types indicates that  
CC the exons should be assigned to a single gene; a peptide comprising one  
CC of 12011 sequences, mentioned in the specification, or encoded by the  
CC probes/open reading frames (ORF). The probes are used for gene expression  
CC analysis, and for identifying exons in a gene, particularly using human  
CC lung derived mRNA, and for the study of lung diseases such as asthma, lung  
CC cancer, chronic obstructive pulmonary disease (COPD), interstitial lung  
CC disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,  
CC tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-  
CC Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary  
CC histiocytosis, lymphangioleiomyomatosis, pulmonary alveolar proteinosis,  
CC Karagenar syndrome, fibrocystic pulmonary dysplasia, primary ciliary  
CC dyskinesia, pulmonary hypertension and hyaline membrane disease. The  
CC present sequence is a single exon probe open reading frame of the  
CC invention. Note: The sequence data for this patent did not form part of  
CC the printed specification, but was obtained in electronic format directly  
CC from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

PS Claim 14; SEQ ID NO 26246; 1766pp; English.  
XX  
XX The invention relates to an isolated nucleic acid comprising any one of  
XX the 6213 antisense sequences given in the specification where expression  
XX of the nucleic acid inhibits proliferation of a cell. Also included are:  
XX (1) a vector comprising a promoter operably linked to the nucleic acid  
XX encoding a polypeptide whose expression is inhibited by the antisense  
XX nucleic acid; (2) a host cell containing the vector; (3) an isolated  
XX polypeptide or its fragment whose expression is inhibited by the  
XX antisense nucleic acid; (4) an antibody capable of specifically binding  
XX the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular  
XX proliferation or the activity of a gene in an operon required for  
XX the gene product or that has an activity against a biological pathway  
XX required for proliferation, or that inhibits cellular proliferation; (8)  
XX identifying a gene required for cellular proliferation or the biological  
XX pathway in which a proliferation-required gene or its gene product lies  
XX or a gene on which the test compound that inhibits proliferation of an  
XX organism acts; (9) manufacturing an antibiotic; (10) profiling a  
XX product is overexpressed or underexpressed; (12) determining the extent  
XX to which each of the strains is present in a culture or collection of  
XX strains; or (13) identifying the target of a compound that inhibits the  
XX proliferation of an organism. The antisense nucleic acids are useful for  
XX identifying proteins or screening for homologous nucleic acids required  
XX for cellular proliferation to isolate candidate molecules for rational  
XX drug discovery programs, or for screening homologous nucleic acids  
XX required for proliferation in cells other than *S. aureus*, *S. typhimurium*,  
XX *K. pneumoniae* or *P. aeruginosa*. The present sequence is one of the target  
XX prokaryotic essential genes. Note: The sequence data for this patent did

XX  
XX New antisense nucleic acids, useful for identifying proteins or screening  
XX for homologous nucleic acids required for cellular proliferation to  
XX isolate candidate molecules for rational drug discovery programs.  
XX  
XX Claim 14; SEQ ID NO 28592; 1766pp; English.  
XX  
XX The invention relates to an isolated nucleic acid comprising any one of  
XX the 6213 antisense sequences given in the specification where expression  
XX of the nucleic acid inhibits proliferation of a cell. Also included are:  
XX (1) a vector comprising a promoter operably linked to the nucleic acid  
XX encoding a polypeptide whose expression is inhibited by the antisense  
XX nucleic acid; (2) a host cell containing the vector; (3) an isolated  
XX polypeptide or its fragment whose expression is inhibited by the  
XX antisense nucleic acid; (4) an antibody capable of specifically binding  
XX the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular  
XX proliferation or the activity of a gene in an operon required for  
XX the gene product or that has an activity against a biological pathway  
XX required for proliferation, or that inhibits cellular proliferation; (8)  
XX identifying a gene required for cellular proliferation or the biological  
XX pathway in which a proliferation-required gene or its gene product lies  
XX or a gene on which the test compound that inhibits proliferation of an  
XX organism acts; (9) manufacturing an antibiotic; (10) profiling a  
XX product is overexpressed or underexpressed; (12) determining the extent  
XX to which each of the strains is present in a culture or collection of  
XX strains; or (13) identifying the target of a compound that inhibits the  
XX proliferation of an organism. The antisense nucleic acids are useful for  
XX identifying proteins or screening for homologous nucleic acids required  
XX for cellular proliferation to isolate candidate molecules for rational  
XX drug discovery programs, or for screening homologous nucleic acids  
XX required for proliferation in cells other than *S. aureus*, *S. typhimurium*,  
XX *K. pneumoniae* or *P. aeruginosa*. The present sequence is one of the target  
XX prokaryotic essential genes. Note: The sequence data for this patent did  
XX not form part of the printed specification, but was obtained in  
XX electronic format directly from WIPO at  
XX ftp.wipo.int/pub/published\_pct\_sequences

 XX Composition useful for diagnosis of conditions, disorders or diseases  
 PT associated with atherosclerosis, comprises several polynucleotides that  
 PT are differentially expressed in foam cell development.  
 XX PS Claim 1; Page 90; 315pp; English.  
 XX The present invention relates to the isolation of human polynucleotide  
 CC sequences that are differentially expressed during foam cell  
 CC differentiation. The polynucleotide sequences of the invention or a  
 CC composition comprising these polynucleotides are useful as a high  
 CC throughput method for detecting altered expression of one or more  
 CC polynucleotides in a sample. The polynucleotides can be used in the  
 CC diagnosis of disorders associated with foam cell development such as  
 CC atherosclerosis, cerebral stroke, and cardiovascular disorders such as  
 CC coronary artery disease. The polynucleotide sequences can also be used as  
 CC PCR primers and probes. The polynucleotides of the invention are also  
 CC useful in gene therapy. AAS94746-AAS95021 represent the human  
 CC polynucleotide sequences of the invention which are differentially  
 CC expressed during foam cell differentiation

 XX Composition comprising atherosclerosis-associated polynucleotide useful  
 PT in diagnosis, prognosis, treatment, and prevention of atherosclerosis and  
 PT stroke, myocardial infarction, or hypertension.  
 XX PS Claim 1; Page 54; 58pp; English.  
 XX The invention provides novel atherosclerosis-associated polynucleotides  
 CC and polypeptides encoded by the genes. Expression vectors and host cells  
 CC for producing the polypeptides are disclosed and methods for screening or  
 CC purifying ligands which specifically bind to the polypeptides are also  
 CC provided. The polynucleotides are useful for treating diseases associated  
 CC with the altered expression of a gene that is coexpressed with one or  
 CC more known atherosclerosis-associated genes in a subject. They are useful  
 CC in diagnosis, prognosis, treatment, prevention, selection and evaluation  
 CC of therapies for atherosclerosis including stroke, myocardial infarction,  
 CC transient cerebral ischemia, mesenteric ischemia, coronary artery  
 CC disease, angina pectoris, peripheral vascular disease, renal artery  
 CC stenosis, and hypertension. Sequences AAC85065-85098 represent

 PT ischemia or stroke, or for staging or treating atherosclerosis-associated  
 PT disorders.

XX Claim 1; SEQ ID NO 22; 60pp; English.

XX The invention relates to a combination of several cDNAs, which are co-

CC expressed with one or more known human atherosclerosis-associated genes,

CC is new. The cDNAs comprise any of 25 sequences appearing as ADM29557-

CC ADM29581or the complements of any of these sequences. Also included are

CC detecting differential expression of one or more cDNAs in a sample

CC containing nucleic acids, using cDNAs to screen a sample and identify a

CC ligand that specifically binds a cDNA, a vector containing the cDNA, a

CC host cell containing the vector, producing a protein, an atherosclerosis-

CC associated protein appearing as ADM29582, using a protein to screen

CC several molecules or compounds (and identify at least one ligand that

CC specifically binds the protein), using a protein to produce an antibody,

CC an antibody produced by the method, and using an antibody to detect gene

CC expression in a sample. The cDNAs are useful for detecting differential

CC expression of one or more cDNAs in a sample containing nucleic acids.

CC This differential expression is diagnostic of angina pectoris, coronary

CC artery disease, myocardial infarction, hypertension, transient cerebral

CC ischaemia, mesenteric ischaemia, peripheral vascular disease, renal

CC artery stenosis, diabetes mellitus, obesity, polycystic ovarian syndrome,

CC or stroke. The cDNAs or proteins are useful for screening a sample and

CC identifying a ligand, which specifically binds a cDNA or protein,

CC respectively. The protein is also useful for producing an antibody for

CC detecting gene expression in a sample. The combination of cDNAs is also

CC useful for staging, treating, or monitoring the progression of, disorders

CC associated with atherosclerosis, such as diabetes mellitus, obesity,

CC polycystic ovarian syndrome, and cancers. The present sequence is a human

CC atherosclerosis-associated cDNA of the invention.

XX Human genome-derived single exon nucleic acid probes useful for analyzing
PT gene expression in human adult liver.
PT
XX
```

---

```
PS Claim 1; SEQ ID NO 4179; 658pp; English.
XX
CC The invention relates to a single exon nucleic acid probe (SENP) (I) for
CC measuring human gene expression in a sample derived from human adult
CC liver, comprising one of 13109 defined nucleotide sequences given in the
CC specification (or complements/ fragments). The probe hybridises at high
CC stringency to a nucleic acid molecule expressed in the human adult liver.
CC (I) may be used for predicting, measuring and displaying gene expression
CC in samples derived from human adult liver. The genes identified may be
CC involved in genetic liver diseases such as cirrhosis,
CC hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is
CC associated with coronary heart disease. ABS25011-ABS51005 represent human
CC liver single exon nucleic acid probes of the invention. Note: The
CC sequence information for this patent does not appear in the printed
CC specification but was obtained in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences

PT
XX
XX Claim 25; SEQ ID NO 3974; 322pp; English.
XX
XX The present invention relates to novel single exon nucleic acid probes.
CC The present sequence is one such probe. The probes are useful for
CC measuring human gene expression in a human breast sample, where the probe
CC hybridises at high stringency to a nucleic acid expressed in the human
CC breast. The probes are useful for predicting, diagnosing, grading,
```

CC staging, monitoring and prognosing diseases of the human breast,  
 CC particularly those diseases with polygenic aetiology. The diseases  
 CC include: breast cancer, disorders of development, inflammatory diseases  
 CC of the breast, fibrocystic changes, proliferative breast disease and non-  
 CC carcinoma tumours. Note: The sequence data for this patent did not form  
 CC part of the printed specification, but was obtained in electronic format  
 CC directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

 XX  
 XX Spatially-addressable set of single exon nucleic acid probes, used to  
 XX measure gene expression in human lung samples.  
 XX  
 XX Claim 1; SEQ ID NO 4107; 634pp; English.  
 XX  
 XX The invention relates to a spatially-addressable set of single exon  
 XX nucleic acid probes for measuring gene expression in a sample derived  
 XX from human lung comprising single exon nucleic acid probes having one of  
 XX 12614 nucleic acid sequences mentioned in the specification, or their  
 XX complements or the 12387 open reading frames derived from the 12614  
 XX probes. Also included are a microarray comprising the novel set of probes  
 XX ; the novel set of probes which hybridise at high stringency to a nucleic

CC acid expressed in the human lung; measuring gene expression in a sample  
 CC derived from human lung, comprising (a) contacting the array with a  
 CC collection of detectably labeled nucleic acids derived from human lung  
 CC mRNA, and (b) measuring the label detectably bound to each probe of the  
 CC array; identifying exons in a eukaryotic genome, comprising (a)  
 CC algorithmically predicting at least one exon from genomic sequences of  
 CC the eukaryote; and (b) detecting specific hybridisation of detectably  
 CC labeled nucleic acids from eukaryote lung mRNA, to a single exon probe,  
 CC having a fragment identical to the predicted exon, the probe is included  
 CC in the above mentioned microarray; assigning exons to a single gene,  
 CC comprising (a) identifying exons from genomic sequence by the method  
 CC above and (b) measuring the expression of each of the exons in several  
 CC tissues and/or cell types using hybridisation to a single exon  
 CC microarrays having a probe with the exon, where a common pattern of  
 CC expression of the exons in the tissues and/or cell types indicates that  
 CC the exons should be assigned to a single gene; a peptide comprising one  
 CC of 12011 sequences, mentioned in the specification, or encoded by the  
 CC probes/open reading frames (ORF). The probes are used for gene expression  
 CC analysis, and for identifying exons in a gene, particularly using human  
 CC lung derived mRNA and for the study of lung diseases such as asthma, lung  
 CC cancer, chronic obstructive pulmonary disease (COPD), interstitial lung  
 CC disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis,  
 CC tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-  
 CC Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary  
 CC histiocytosis, lymphangioleiomyomatosis, pulmonary alveolar proteinosis,  
 CC Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary  
 CC dyskinesia, pulmonary hypertension and hyaline membrane disease. The  
 CC present sequence is a single exon probe of the invention. Note: The  
 CC sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequences

PS		
XX		
XX	The invention relates to 2175 novel human ovarian antigens (ABP41054-	
CC	ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also	
CC	encompasses polypeptides 90% identical and polynucleotides 95% identical	
CC	to the sequences of the invention. The invention additionally relates to	
CC	recombinant vectors and host cells comprising human ovarian antigen	
CC	polynucleotides, antibodies against human ovarian antigens, and the use	
CC	of ovarian antigen polynucleotides and polypeptides in diagnosing,	
CC	treating, prognosing or preventing various ovary and/or breast-related	
CC	disorders. Such conditions include ovarian cancer and breast cancer, and	
CC	metastatic tumours of ovarian or breast origin, reproductive system	
CC	disorders (e.g., infertility, disorders of pregnancy, anovulation,	
CC	polycystic ovary syndrome, ovarian cysts, and dysmenorrhea), endocrine	
CC	disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic	
CC	shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and	
CC	vaginitis), immune disorders (e.g., congenital and acquired	
CC	immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus),	
CC	blood-related disorders (e.g., anaemia), cardiovascular disorders,	
CC	respiratory disorders, neurological disorders, gastrointestinal disorders	
CC	and urinary system disorders. Ovarian antigen polypeptides and	
CC	polynucleotides may also be used in screening for compounds which	
CC	modulate ovarian antigen expression or activity. The polynucleotides may	
CC	further be used for gene therapy, chromosome mapping, in the	
CC	identification of individuals and in forensic analysis, and the	
CC	polypeptides may be used as food additives or to prepare antibodies	
CC	useful in disease diagnosis, drug targeting and phenotyping. The present	
CC	sequence represents a cDNA encoding a human ovarian antigen of the	
CC	invention. Note: The sequence data for this patent did not form part of	
CC	the printed specification, but was obtained in electronic format directly	
CC	from WIPO at <a href="http://ftp.wipo.int/pub/published_pct_sequences">ftp.wipo.int/pub/published_pct_sequences</a>

PS	Claim 13; SEQ ID NO 151; 39pp; English.	
XX		
CC	This invention relates to a novel screening method identified as a multi-	
CC	parameter high throughput screening (MPHTS) assay. Specifically, it	
CC	refers to an assay that utilises the disease signature of a plurality of	
CC	specific genes associated with a particular disease, and identifies	
CC	differential expression between those cells taken from individuals	
CC	affected by that disease and those that are not affected. The present	
CC	invention then describes the screening of candidate pharmaceutical	
CC	compounds to identify those that have a potential therapeutic benefit for	
CC	the treatment of neuropsychiatric and neurodegenerative disorders	
CC	including schizophrenia, bipolar affective disorder (BAD) and autism, as	
CC	well as Parkinson's and Alzheimer's disease. Accordingly, the compounds	
CC	of this invention exhibit various activities including neuroleptic,	
CC	nootropic, antimanic and antidepressant. Furthermore, the screening	
CC	method used in MPHTS will be automated, such that a large number of test	
CC	compounds may be rapidly screened with a minimal amount of labour and	
CC	effort. This polynucleotide is a human cDNA sequence of a gene that is	
CC	differentially expressed in the presence of the therapeutic compound	
CC	valproate, given in an exemplification of the invention.

 PT profiles and microarray technology, useful for diagnosing and treating  
 PT rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and  
 PT gout.  
 XX Disclosure; Page; 56pp; English.  
 XX The invention relates to a novel method for diagnosing and analysing  
 CC autoimmune disease or arthritides. The method comprises obtaining a  
 CC patient sample containing mRNA, analysing gene expression using the mRNA  
 CC that results in a gene expression signature of the mRNA, and using that  
 CC gene expression signature to diagnose or analyse the autoimmune disease  
 CC or arthritides in the patient, where gene expression of at least 60% of  
 CC the genes correlates with that of the gene signature. The invention  
 CC further comprises: a treatment of rheumatoid arthritis; identification of  
 CC genes for targeting in the treatment of rheumatoid arthritis in a mammal  
 CC other than a mouse; diagnosis of rheumatoid arthritis in a mammal; an  
 CC array or gene chip, specific for rheumatoid arthritis; diagnosis or  
 CC analyses of autoimmune disease or rheumatoid arthritis; screening the  
 CC efficacy of a candidate drug in vitro for the treatment of collagen-  
 CC induced arthritis; and reducing the symptoms associated with collagen-  
 CC induced arthritis. The compositions of the invention have the following  
 CC activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic,  
 CC antigout, antiinflammatory, dermatological, and immunomodulatory. The  
 CC methods and compositions of the present invention are useful for  
 CC diagnosing and treating autoimmune disease or arthritides, such as  
 CC rheumatoid arthritis, lupus, ankylosing spondylitis, fibrositis,  
 CC fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and an  
 CC immune disease caused by an infectious agent. This polynucleotide  
 CC represents a DNA sequence relating to the genes used in the analysis and  
 CC treatment of autoimmune diseases or arthritides. Note: This sequence is  
 CC not shown in the specification. It has been supplied in an electronic  
 CC format from WIPO.

PT	New isolated nucleic acids and encoded polypeptides useful for detecting	
PT	Mycobacterium paratuberculosis, and as antibacterial vaccines.	
XX		
PS	Claim 39; SEQ ID NO 23; 38pp; English.	
XX		
CC	The invention relates to Mycobacterium avium subsp. paratuberculosis (M.	
CC	paratuberculosis) nucleic acid molecules. A nucleic acid of the invention	
CC	combined with a second nucleic acid will generate an amplification	
CC	product from M. paratuberculosis but not from human, pseudomonas	
CC	aeruginosa, Streptomyces viridochromogenes, mouse, cat or Xanthomonas	
CC	campestris. The nucleic acids and other sequences specific for	
CC	Mycobacterium paratuberculosis are used to detect M. paratuberculosis in	
CC	e.g. milk, faeces or blood. The polypeptides encoded by these sequences	
CC	and antibodies directed against them, are also used to detect M.	
CC	paratuberculosis by immunoassay. The nucleic acids and the polypeptides	
CC	are also used as vaccines to prevent infection (Johnes's disease) by M.	
CC	paratuberculosis. The antibodies are also useful for polypeptide	
CC	purification. This sequence represents an M. paratuberculosis nucleic	
CC	acid of the invention.

XX Novel prostatic-cancer marker polypeptide, useful for diagnosing
XX prostatic-cancer or androgen independent prostatic-cancer.
XX
XX Claim 23; SEQ ID NO 64; 43pp; Japanese.
XX
XX The invention relates to a novel prostatic cancer marker polypeptide
XX comprising any one of 35 fully defined amino acid sequences (SEQ ID NOS:1
XX -35) as given in specification. Prostate-specific antigen (PSA) is
XX currently widely used as a prostatic tumor marker. Certain problems are
XX associated with diagnosis using PSA, however, such as false positives and
XX ambiguity between benign and malignant results. The polypeptides of the
XX invention demonstrate cytostatic activity and may be useful for
XX diagnosing and treating prostatic cancer or androgen-independent
XX prostatic cancer. The polypeptides may be utilized for immunotherapy. The
XX current sequence is that of the human prostatic cancer marker, PEG3
XX Kruppel-type zinc finger DNA of the invention.

XX
XX Claim 3; Page 13-15; 39pp; English.
XX
XX The present invention relates to the isolation of cDNA fragments and the
XX full-length cDNA sequence encoding human paternally expressed gene 3
XX (PEG3). PEG3 is a zinc finger protein thought to act as a transcription
XX factor. The polynucleotide sequences encoding PEG3 are useful in gene
XX therapy to increase or decrease (using the antisense form of the nucleic
XX acid) the expression of PEG3 in cells of a human patient, particularly
XX for modifying or controlling body weight (to treat obesity) or behaviour,
XX or for thermoregulation. The PEG3 polynucleotide sequence is also useful
XX in diagnostic assays, e.g. for testing an individual's susceptibility to
XX obesity or a thermoregulatory disorder, or for diagnosing and staging
XX diseases involving cell death and degeneration (e.g. Alzheimer's
XX disease). The PEG3 polypeptide is useful for prophylactic and/or
XX therapeutic treatment. The present sequence encodes human PEG3

XX	PT	New isolated, enriched or purified nucleic acid molecule encoding a kinase polypeptide, useful for treating cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated diseases and metabolic disorders.	
XX	PS	Claim 33; SEQ ID NO 116; 491pp; English.	
XX	CC	The invention relates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and encodes a naturally occurring kinase polypeptide; (d) encodes the polypeptide in (a), except that it lacks one or more, but not all, of an N-terminal domain, C-terminal catalytic domain, a catalytic domain, a C-terminal domain, a coiled-coil structure region, a spacer region and a C-terminal tail; or (e) is a complement of (d). The nucleic acid molecules, polypeptides, methods and substance are useful for treating cancers, immune-related diseases or disorders, cardiovascular disease, brain or neuronal-associated diseases, and metabolic disorders. The disorders are preferably cancers of the tissues or of hematopoietic origin, diseases of the central or peripheral nervous system, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, infections caused by bacteria, infections caused by fungi, ocular diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders, dyskinesias, metabolic disorders and organ transplant rejection. This sequence corresponds to the DNA encoding one of the kinase polypeptides of the invention.

XX	PS	Claim 33; Fig 4; 496pp; English.
XX	CC	The present invention relates to a method for detecting remote polypeptide homologues, comprising analysis of conserved secondary structure pattern in a protein family, and conserved active site amino acid residues. The analyses are used to identify conserved residues embedded into the secondary structure pattern (CRISP), which are used to detect remote homologues of the referent protein family, wherein said referent protein family is the protein kinase family. The present sequence is the coding sequence for a kinase, used to illustrate the method of the invention. The kinases are useful for diagnosing or treating various kinase-related diseases and conditions. Diseases or disorders include cancers, immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases, or metabolic disorders. Preferably, the diseases or disorders are cancers of tissues, cancers of hematopoietic origin, diseases of the central nervous system, diseases of the peripheral nervous system, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, infections caused by bacteria, infections caused by fungi, or ocular diseases. The disease or disorder is also migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypertension, psychotic disorders, neurological disorders, dyskinesias, metabolic disorders, or organ transplant rejection.

XX Detecting an ovarian cancer-associated transcript in a cell from a
XX patient, comprises contacting a biological sample from the patient with a
XX polynucleotide that hybridizes to an ovarian cancer gene.
XX Claim 10; Page 316-317; 332pp; English.
XX
XX The invention relates to a method of detecting an ovarian cancer-
XX associated transcript in a cell from a patient, by contacting a
XX biological sample from the patient with a polynucleotide that selectively
XX hybridizes to a sequence at least 80% identical to any of one of 80
XX nucleic acid sequences given in the specification. The method is useful
XX in diagnosing ovarian cancer and in identifying and using agents and/or
XX targets that inhibit ovarian cancer. The nucleic acid molecule,
XX polypeptide and the antibody may also be used in detecting ovarian
XX cancers, monitoring and early detection of relapse following treatment,
XX monitoring response to therapy, selecting patients for post-operative
XX chemotherapy or radiation therapy, in selecting mode of therapy,
XX determining tumour prognosis, early detection of pre-cancerous lesions,
XX and as vaccines. This sequence corresponds to one of the nucleic acids
XX used for the detection method of the invention.

CC carrier; an antibody directed against the polypeptide of (3); a method  
 CC for detecting (1) in a sample; a method for detecting the polypeptide of  
 CC (3) in a sample; a method for identifying a compound that binds to the  
 CC polypeptide of (3); a method for producing the polypeptide of (3); and a  
 CC collection of polynucleotides, where the collection comprising of at  
 CC least one of SEQ ID NOS: 1-567. (1) is a polynucleotide comprising any of  
 CC the sequences of SEQ ID NOS: 1-567 encoding a polypeptide with biological  
 CC activity, which comprises any of the amino acid sequence of SEQ ID NOS:  
 CC 568-1134. All sequences are fully defined in the specification. The  
 CC sequences and methods are useful in diagnostics, forensic, and gene  
 CC mapping, in identifying of mutations responsible for genetic disorders or  
 CC other traits, in assessing biodiversity, and for producing many other  
 CC types of data and products dependent on DNA and amino acid sequences. The  
 CC composition and method are useful for treating a disease or disorder,  
 CC e.g. osteoporosis, osteoarthritis, periodontal disease, burns, CNS and  
 CC peripheral disease, Alzheimer's disease, Parkinson's disease, stroke,  
 CC autoimmune disorders, viral infection, or cancer. This sequence encodes a  
 CC novel polypeptide of the invention.

XX Human proteins and DNA encoding sequences useful for preventing, treating

PT or ameliorating a medical condition in a mammalian subject e.g. arthritis  
 PT and cancer.

PS Claim 1; Page 1002-1004; 1963pp; English.

XX Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and  
 CC sequences ABA09225-ABA09574 represent nucleic acids encoding them. The  
 CC invention also relates to vectors and recombinant host cells comprising a  
 CC nucleotide of the invention, methods of producing the novel polypeptides,  
 CC antibodies against the polypeptides, methods of detecting the nucleotides,  
 CC or polypeptides in a sample, and methods of identifying compounds which  
 CC bind to polypeptides of the invention. Although novel, many of the  
 CC polypeptides of the invention have homology to known proteins, and thereby  
 CC giving an insight into their probable biological activities, and hence  
 CC potential therapeutic applications. The polypeptides of the invention may  
 CC have various activities, including cytokine, cell proliferation or cell  
 CC differentiation activities; stem cell growth factor activity;  
 CC haematopoiesis regulatory activity; tissue growth activity;  
 CC immunomodulatory activity; activin- or inhibin-related activities;  
 CC chemotactic or chemokinetic activities; haemostatic, thrombotic or  
 CC thrombolytic activities; receptor or ligand activities; or may be  
 CC involved in oncogenesis; cancer cell proliferation or metastasis.  
 CC Depending on their biological activities, polypeptides and nucleotides of  
 CC the invention are useful for preventing, treating or ameliorating medical  
 CC conditions, e.g., by protein or gene therapy. Such conditions include  
 CC cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell  
 CC disorders), chronic inflammatory conditions (e.g., asthma or arthritis),  
 CC proliferative retinopathy, atherosclerosis, coronary heart disease,  
 CC arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal  
 CC vascular growth. Polypeptides involved with tissue regeneration and  
 CC repair (or nucleic acids encoding them) may be used to promote wound  
 CC healing (e.g., of burns, incisions and ulcers), while those with  
 CC immunomodulatory activities may be used in the treatment of viral,  
 CC bacterial and fungal infections in addition to immune disorders.  
 CC Polypeptides with growth factor activity may be used in cell cultures to  
 CC promote cell growth. For example, such polypeptides may be used to  
 CC manipulate stem cells in culture to give rise to neuroepithelial cells  
 CC that can be used to augment or replace cells damaged by illness,  
 CC autoimmune disease or accidental damage. The polypeptides and nucleotides  
 CC may also be used in the diagnosis of the above conditions, and in drug  
 CC screening techniques. The present sequence represents a cDNA encoding a  
 CC novel human polypeptide of the invention

XX
XX Combination useful for preparing a composition for treating liver
PT disorders associated with steroid therapy, e.g., cirrhosis or hepatitis,
PT comprises cDNAs that are differentially expressed in response to steroid
PT treatment.
XX
XX Claim 1; SEQ ID NO 560; 141pp; English.
PS
XX The invention relates to a combination comprising cDNAs that are
CC differentially expressed in response to steroid treatment. Also included
CC are the following: a high throughput method for using a cDNA to detect
CC differential expression of nucleic acids in a sample; and a high
CC throughput method of screening molecules or compounds to identify a
CC ligand that specifically binds a cDNA. The sample is from a subject with
CC Wilson disease and comparison of a standard defines a stage of that
CC disease. The high throughput method of screening molecules or compounds
CC to identify a ligand that specifically binds a cDNA comprises: combining
CC the combination with molecules or compounds under conditions to allow
CC specific binding; and detecting specific binding between each cDNA and at
CC least one molecule or compound. The molecules or compounds are regulatory
CC proteins. The combination is useful for preparing a composition for
CC treating liver disorders associated with steroid therapy, e.g., cirrhosis
CC or hepatitis. The present sequence represents a human cDNA which is
CC differentially expressed in steroid-induced C3A liver cells. Note: The
CC sequence data for this patent did not form part of the printed
CC specification but was obtained in electronic format directly from USPTO
CC at seqdata.uspto.gov/sequence.html.

PA (KASE/) KASER M R.
XX
PI Kaser MR;
XX
XX WPI; 2004-031227/03.
XX
XX Composition comprising several cDNAs that are differentially expressed in
PT treated human C3A liver cell cultures, useful for treating liver
PT disorders.
XX
XX Claim 1; SEQ ID NO 223; 41pp; English.
PS
XX The invention relates to a composition comprising several cDNAs that are
CC differentially expressed in a liver disorder. The composition is useful
CC for treating liver disorder such as hyperlipidaemia, hypertension, type
CC II diabetes, tumours of the liver and disorders of the inflammatory and
CC immune response. The composition is useful for a high-throughput method
CC of screening several molecules or compounds to identify a ligand which
CC specifically binds a cDNA. A protein encoded by the cDNA is useful for a
CC high-throughput method for using a protein to screen several molecules or
CC compounds to identify at least one ligand which specifically binds the
CC protein which involves combining the protein encoded by the cDNA with
CC several of molecules or compounds under conditions to allow specific
CC binding, and detecting specific binding between the protein and a
CC molecule or compound, therefore identifying a ligand which specifically
CC binds the protein. The composition is useful for detecting and
CC quantifying differential gene expression, can be used in gene therapy, to
CC formulate prognosis and to design a treatment regimen and to monitor the
CC efficacy of treatment. The present sequence represents a cDNA
CC differentially expressed in a liver disorder.

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 37745; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/hematopoietic antigen (I) amino acid sequences given in AAK82170 to AAK91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to

CC supplement the patients own production of (I). Additionally, (I)  
CC polynucleotides may be used to produce the secreted (I), by inserting the  
CC nucleic acids into a host cell and culturing the cell to express the  
CC protein. (I) proteins and polynucleotides may be used to prevent,  
CC diagnose and treat immune/haematopoietic-related diseases, especially  
CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703  
CC to AAK87694 represent human immune/haematopoietic antigen genomic  
CC sequences from the present invention. AAK54942 to AAK54950 and AAK82169  
CC represent sequences used in the exemplification of the present invention

XX  
XX (HUMA-) HUMAN GENOME SCI INC.  
XX  
XX Rosen CA, Barash SC, Ruben SM;  
XX WPI; 2001-483426/52.  
XX  
XX Nucleic acids encoding human immune/hematopoietic antigen polypeptides,  
XX useful for preventing, diagnosing and/or treating cancers and metastasis.  
XX  
XX Disclosure; SEQ ID NO 37746; 3071pp + Sequence Listing; English.  
XX  
XX AAK54951 to AAK64702 encode the human immune/hematopoietic antigen (I)  
XX amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic  
XX activity, and can be used in gene therapy and vaccine production. (I)  
XX proteins and polynucleotides may be used in the prevention, diagnosis and  
XX treatment of diseases associated with inappropriate (I) expression. For  
XX example, they may be used to treat disorders associated with decreased  
XX expression by rectifying mutations or deletions in a patient's genome  
XX that affect the activity of (I) by expressing inactive proteins or to  
XX supplement the patients own production of (I). Additionally, (I)  
XX polynucleotides may be used to produce the secreted (I), by inserting the  
XX nucleic acids into a host cell and culturing the cell to express the  
XX protein. (I) proteins and polynucleotides may be used to prevent,  
XX diagnose and treat immune/hematopoietic-related diseases, especially  
XX cancers and cancer metastases of hematopoietic-derived cells. AAK64703  
XX to AAK87694 represent human immune/hematopoietic antigen genomic  
XX sequences from the present invention. AAK54942 to AAK54950 and AAM82169  
XX represent sequences used in the exemplification of the present invention

XX  
XX Predicting toxicity of compounds, useful in development of safe drugs, by  
XX measuring the differential expression of specific genes in cells exposed  
XX to test compounds.  
XX  
XX Claim 2; SEQ ID NO 556; 895pp; English.  
XX  
XX The invention relates to methods of predicting at least one toxic effect  
XX (or toxicity progression or the mechanism of toxicity) of a compound. The  
XX methods involve detecting the level of expression of at least one of a  
XX set of 80 genes ADW21622-ADW22301 or at least one of a set of 17 genes  
XX (including ADW22362, ADW22414 and ADW22481-ADW22483) in a tissue or cell  
XX exposed to the compound, and determining whether the gene is  
XX differentially expressed compared with a control tissue or cell.  
XX  
XX Differential expression of the gene in the presence of the compound is  
XX indicative of a toxic effect, of toxicity progression or of a specific  
XX mechanism of toxicity. The toxic effect is especially hepatotoxicity,  
XX particularly hepatitis, liver necrosis, protein adduct formation or fatty  
XX liver. The invention also relates to sets of primers and probes specific  
XX for at least two genes selected from ADW21622-ADW22301; solid supports  
XX (e.g., DNA chips) and kits containing the probes; and a database  
XX containing DNA sequence information and expression information for at  
XX least two of the 80 genes from hepatotoxin-exposed tissues. The  
XX invention is based on the determination of global changes in gene  
XX expression in tissues or cells exposed to known toxins, particularly  
XX hepatotoxins, and the identification of individual genes (toxicity  
XX markers) that are differentially expressed on toxin exposure. The changes  
XX in gene expression can be characteristic of different mechanisms of  
XX hepatotoxicity mediated by various classes of compounds. Such compounds  
XX include: direct acting compounds which cause damage to macromolecules,  
XX especially proteins and lipids by directly interacting with them;  
XX steatotic compounds which cause an accumulation of fat in the liver; and  
XX cholestatic compounds which impair bile flow or bile acid transport,  
XX resulting in jaundice. The methods of the invention are useful in  
XX toxicology screening for predicting the toxic effects (especially  
XX hepatotoxic effects) of compounds for the development of safer drugs.  
XX Sequences ADW21622-ADW22301 represent specifically claimed hepatotoxicity  
XX marker genes of rat origin whose expression is altered on exposure to  
XX hepatotoxins.

XX

PT Identifying a compound that can treat disease or disorders, such as, a  
PT neuropsychiatric disorder e.g., schizophrenia, or autism, comprises  
PT determining the expression of one or more efficacy genes in a cell  
PT contacted with the test compound.

PS Claim 9; SEQ ID NO 97; 39pp; English.

XX This invention relates to a novel screening method identified as a multi-  
XX parameter high throughput screening (MPHTS) assay. Specifically, it  
XX refers to an assay that utilizes the disease signature of a plurality of  
XX specific genes associated with a particular disease, and identifies  
XX differential expression between those cells taken from individuals  
XX affected by that disease and those that are not affected. The present  
XX invention then describes the screening of candidate pharmaceutical  
XX compounds to identify those that have a potential therapeutic benefit for  
XX the treatment of neuropsychiatric and neurodegenerative disorders  
XX including schizophrenia, bipolar affective disorder (BAD) and autism, as  
XX well as Parkinson's and Alzheimer's disease. Accordingly, the compounds  
XX of this invention exhibit various activities including neuroleptic,  
XX nootropic, antimanic and antidepressant. Furthermore, the screening  
XX method used in MPHTS will be automated, such that a large number of test  
XX compounds may be rapidly screened with a minimal amount of labour and  
XX effort. This polynucleotide is the cDNA sequence of a gene that is  
XX differentially expressed in mice in the presence of the therapeutic  
XX compound valproate, given in an exemplification of the invention.

```
CC This invention relates to novel isolated polynucleotides of human origin,
CC particularly isolated from the human prostate. Specifically, it refers to
CC the diagnostics and therapeutics comprising these novel human
CC polynucleotides, and includes the derived probes, antisense
CC oligonucleotides and antibodies thereof. The identification of these
CC human prostate genes that can inhibit tumour growth is useful for
CC understanding the progression and nature of complex diseases such as
CC cancer, and hence they are important in the drug discovery process. The
CC present invention describes these polynucleotides and encoded
CC polypeptides as exhibiting cytostatic activity, and through gene therapy
CC and/or vaccines they can be used to modulate the immune response for the
CC prevention or treatment of cancers, particularly of the prostate, but
CC also for breast, lung and colon cancer. This polynucleotide sequence is a
CC human cDNA sequence useful for the treatment of cancer, used in an
CC exemplification of the invention. NOTE: These sequences are not given in
CC the specification but are provided on the WIPO website.

XX
XX New genes and gene products isolated from human prostate, useful for
XX treating or diagnosing tumor or cancer (e.g. prostate cancer or breast
XX cancer), or as vaccines for treating or preventing these diseases.
XX
XX PS Claim 1; SEQ ID NO 423; 186pp + Sequence Listing; English.
XX
XX The invention relates to an isolated polynucleotide comprising any of
XX 1477 sequences or its fragment, degenerate variant, antisense or
XX complement. The polynucleotides and gene products are useful for treating
XX or diagnosing tumour or cancer (e.g. prostate cancer, breast cancer, lung
XX cancer or medullary carcinoma) in a subject (e.g. cattle, dogs, cats,
XX rabbits, horse or human). The polynucleotides and polypeptides are also
```

CC useful as vaccines for treating or preventing these diseases. The  
CC polynucleotides are useful for gene therapy. The present sequence is that  
CC of one of a group of polynucleotides (ABQ8745-ABQ90015) disclosed  
CC electronically as sequences of the invention. However only 1271  
CC polynucleotide sequences are given, whereas 1477 polynucleotides and 91  
CC proteins are claimed. Note: The sequence data for this patent did not  
CC form part of the printed specification, but was obtained in electronic  
CC format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence

PT Novel human polynucleotides that correspond to human gene trapped  
PT sequences useful for gene discovery, gene therapy, as markers for gene  
PT expression analysis, forensic analysis and determining genetic basis of  
PT diseases.  
XX  
PS Claim 1; SEQ ID NO 447; 36pp; English.  
XX  
CC This invention describes isolated or purified polynucleotides  
CC corresponding to human gene trapped sequence (GTS) comprising a sense or  
CC antisense sequence chosen from 1000 sequences or its fragment of 8  
CC contiguous nucleotides. GTSs are useful for gene discovery and as markers  
CC for gene expression analysis, identifying and mapping the coding regions  
CC of the mammalian and particularly human, genome, forensic analysis, for  
CC cross species hybridisation analysis, genetic manipulation, antisense  
CC inhibition, gene targeting, identification or generation of full-length  
CC cDNA, mapping the human genome, gene or antisense therapy, gene delivery  
CC and determining the genetic basis of human disease. Portion of the GTS  
CC sequences are useful as a hybridisation probe or for chromosome mapping,  
CC

CC and can be incorporated into phage display system that can be used to  
CC screen for proteins, or other ligands, that are capable of binding an  
CC amino acid sequence encoded by the GTS sequences. The GTS sequences are  
CC also useful to regulate gene expression, as a part of ribozyme and/or  
CC triple helix sequences that can be used to regulate gene expression, as  
CC components of diagnostic methods, for analysing single nucleotide  
CC polymorphisms, and also as genetic markers for prenatal analysis of  
CC congenital traits or defects. The polynucleotides of the invention are  
CC useful for diagnosis, prognosis of disorders involving developmental and  
CC differentiation processes and for the identification of subjects having a  
CC predisposition to such disorders. Diseases or natural processes that can  
CC be correlated with the expression of mutant or normal, variants of GTSs  
CC include, aging, cancer, autoimmune disease, Crohn's disease, multiple  
CC sclerosis, immune disorders, schizophrenia, skin disorders, rheumatoid  
CC arthritis, atherosclerosis, cardiovascular disease, degenerative diseases  
CC of the neural or skeletal systems, Alzheimer's disease, osteoporosis,  
CC asthma, and infections. GTSs can also be used to identify the specific  
CC locations of exon splice junctions, which are important in the study of  
CC disease and cancer. Modulating the level of expression of one or more  
CC genes and/or regulating activity of one or more peptides or proteins is  
CC useful for modifying development and cell differentiation and treating  
CC development and cell differentiation disorders. ABX64402-ABX65401  
CC represent the human gene trapped cDNA sequences described in the  
CC disclosure of the invention. NOTE: The sequence data for this patent did  
CC not form part of the printed specification but was obtained in electronic  
CC format directly from USPTO at

DR  
XX New isolated nucleic acid molecule, useful for drug screening and  
PT toxicity assays or for assessing the impact, including toxicity, of a

PT compound, pharmaceutical agent or environmental pollutant on a cell or  
XX living organism.  
PS Claim 1; SEQ ID NO 1683; 41pp; English.  
XX  
XX This invention is related to a novel isolated canine nucleic acid  
CC sequences and the construction of canine microarrays containing a  
CC significant portion of the canine genome. The isolated canine nucleic  
CC acid sequences of the invention may be useful for drug screening and  
CC toxicity assays. The invention is therefore useful for assessing the  
CC impact, including toxicity, of a compound, pharmaceutical agent or  
CC environmental pollutant on a cell or living organism. The methods are  
CC useful for detecting genes that are up- or down-regulated in canines in a  
CC disease state. The sequences are useful as diagnostic agents or markers  
CC to detect a cellular response in a sample individually or as part of a  
CC gene expression profile. It is also useful as a target for agents that  
CC modulate gene expression or activity. The database is useful for  
CC producing electronic Northern blots that allow the user to determine the cell  
CC type or tissue in which a given gene is expressed and to allow  
CC determination of the abundance or expression level of a given gene in a  
CC particular tissue or cell. The methods are useful for determining the  
CC similarity of a toxic response to one or more individual compounds. The  
CC methods are useful for predicting at least one toxic response or the  
CC likelihood that a compound or test agent will induce various specific  
CC pathologies such as those of the liver (liver necrosis, fatty liver  
CC disease, protein adduct formation or hepatitis), those of the kidney,  
CC heart, brain or testes, or other pathologies associated with at least one  
CC of the toxins. The methods are also useful for predicting or elucidating  
CC the potential cellular pathways influenced, induced or modulated by the  
CC compound or test agent due to the similarity of the expression profile  
CC compared to the profile induced by a known toxin. The present sequence is  
CC that of a canine DNA sequence which was claimed for use during the  
XX production of a canine microarray of the invention.

XX Detection of expression of specific Aspergillus genes for monitoring the  
PT fermentation and growth conditions of the fungus, using DNA probes.  
XX  
XX Claim 1; SEQ ID NO 3910; 48pp + Sequence Listing; Japanese.  
XX  
XX The invention relates to a polynucleotide having any of 6006 specific  
CC sequences (ABZ50888-ABZ56893), which are expressed by a fungus under  
CC specific culture conditions including one or more of eutrophic,  
CC oligotrophic, solid, early germination, alkaline, high temperature, low  
CC temperature or maltose culture or polynucleotides stringently hybridising  
CC to these sequences. The polynucleotides are useful for monitoring the

CC progress of fermentation and the growth conditions of a fungus,  
 CC especially of Aspergillus oryzae which is widely used in industrial  
 CC fermentation. Also monitoring for fungal contamination. Note: The  
 CC sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequences

This is single pass sequence recovered from the left border of
TDNA. This sequence lies within an annotated exon of At3g21150.
Class: TDNA tagged.

/lab_host="Escherichia coli BM25.8"
/clone_lib="(FHIG:C) Axenic plate culture"
/notes=Vector: pTriplex2; Site_1: SfiI; Site_2: SfiI; This
EST clone is originating from one of three cDNA libraries,
constructed for transcript profiling of the mycorrhizal
interaction between the basidiomycete Paxillus involutus
and Betula pendula (birch). One library represents the
developed and functional mycorrhizal root tissue
('FHIG:A) Ectomycorrhiza plate culture'), a second
library represents axenically grown fungus ('FHIG:B)
Axenic plate culture') and a third library represents
axenically grown plants ('FHIG:C) Axenic plate culture').
Libraries were analyzed in parallel and 3555 (FHIG:A),
3964 (FHIG:B), and 2532 (FHIG:C) high-quality (PHRED 20)
ESTs of >99bp have been deposited. The cDNA libraries were
constructed from total RNA using the SMART cDNA library
construction kit (HK1051-1, Clontech, Palo Alto, CA, USA)
according to the manufacturer's instructions. Full-length
cDNAs were trimmed by SfiI, fractionated and directionally
ligated into (lambda)Triplex2 arms. The lambda library was
converted to a plasmid library via site-specific
recombination at loxP sites in a Cre+ strain (E. coli
BM25.8). Plasmid clones were randomly collected and
analysed by DNA sequencing using a plasmid-specific
forward primer (P104)."

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M University BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
partial digest.
Seq primer: M13 For
Class: BAC ends.

            /notes="Vector: Express 1; Total and poly A+ RNA was
                isolated from the indicated stickleback tissue, and a cDNA
                library was constructed in the Express 1 plasmid vector by
                Open Biosystems. First strand cDNA synthesis was primed
                with an 54 bp linker primer containing an oligodt sequence
                preceded by a synthetic NotI site (first strand primer:
                5'-GACTAGTCTAGATCGGCGGCCGCTT)25-3'. Following
                second strand synthesis, cDNAs were made blunt at the end
                corresponding to the original 5 prime end of mRNA, and
                cloned directionally into the NotI and EcoRV sites of
                Express 1. Note that the EcoRV site is typically destroyed
                in the blunt end cloning, leaving a junction of the form
                'xxxATC' (where is ATC is the second half of the EcoRV
                site, and xxx is derived from the cDNA sequence). A map of
                the Express 1 vector is available at:
                http://www.openbiosystems.com/cdna_library_construction_fa
                q.php#8 The primary library was transformed and amplified
                in DH10B (T1 phage resistant) bacteria. Clones available
                from Open Biosystems:
                http://www.openbiosystems.com/stickleback"

 /notes="Vector: pCMV-SPORT6 (Invitrogen); Site 1: SalI; Site 2: NotI; Mouse cDNA project by the Laboratory of Genetics, National Institute on Aging (NIA), Intramural Research Program, NIH (http://lgsun.grc.nia.nih.gov/cDNA). This is a long-transcript enriched cDNA library (Ref. Genome Res. 11: 1553-1558 (2001). [PMID: 11544199]). ES cells were plated at density 3x10<sup>4</sup>/cm<sup>2</sup>, on gelatin-coated plates and cultured for 48 hrs at 37 °C, 5% CO<sub>2</sub>. Culture medium: DMEM supplemented with 15% FBS, 2 mM L-glutamine, 0.1 mM NEAA, 1mM Sodium pyruvate, 0.1 mM beta-mercaptoethanol, 100 U/ml penicillin, and 100 ug/ml streptomycin. Double-stranded cDNAs were synthesized with an Oligo(dT) primer (Invitrogen): 5'-pGACTAGTTCAGTCGCGCGCGCCCTTTT-3' from 2ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 3.4 kb. The library was constructed by Yulan Piao."

NotI; Mouse cDNA project by the Laboratory of Genetics,

National Institute on Aging (NIA), Intramural Research

Program, NIH (http://lgsum.grc.nia.nih.gov/cDNA). This is

a long-transcript enriched cDNA library (Ref. Genome Res.

11: 1553-1558 (2001). [PMID: 11544199]. Total RNAs were

obtained from Dr. Angelo L. Vescovi (Institute for Stem

Cell Research, Italy). Double-stranded cDNAs were

synthesized with an Oligo(dT) primer [Invitrogen:

5'-pGACTAGTTCATGACGCGCGCCCTTTT-3'] from

2.0 Microgram of total RNA, treated with T4 DNA

polymerase, and purified by ethanol-precipitation. The

cDNAs were ligated to lone-linker L1-Sal4, purified by

phenol/chloroform, and separated from free linkers by

Centricon 100. Then, the cDNAs were amplified by

long-range high fidelity PCR using Ex Taq polymerase

(Takara) with a primer Sal4-S. The products were purified

by phenol/chloroform and Centricon 100. The cDNAs were

digested with SalI and NotI enzymes and cloned into

SalI/NotI site of pSPORT1 plasmid vector. The DH10B E.

coli host was transformed with the ligation mixture by the

standard chemical method. The average insert size is about

3.2 kb. The library was constructed by Yulan Piao."

This is a long-transcript enriched cDNA library [Ref. Genome Res. 11: 1553-1558 (2001). PMID: 11544199]. Total RNAs were obtained from Dr. Janet Rossant and Tilo Kunath (Samuel Lunenfeld Research Institute, Canada). Double-stranded cDNAs were synthesized with an Oligo (dT) primer (Invitrogen):  
 5'-pGACTAGTCTAGTCGCGAGCGCGCCCTTTT-3' from 4 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer sal4-S. The products were purified by phenol/chloroform and Centricon 100. The cDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pCMV-SPORT6 plasmid vector. The DH10B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.6 kb. The library was constructed by Yulan Piao."

XhoI; Gamete library was constructed by Hui Zhao, Min Lu,
Jeffrey McDermott, William J. Snell and John Davies.
Strain 21gr cells (CC-1690; mating type plus) and strain
6145c cells (CC-1691; mating type minus) that had been
growing on a light-dark cycle (13:11 L/D) in R-medium
(Sager and Granick) were separately transferred into
nitrogen-free medium at 8 hours into the light period.
PolyA mRNA was purified from each sample every 2 hours for
the next 18 hours. The mRNA was pooled and used for cDNA
synthesis. The cDNA was directionally cloned into lambda
Zap II (Stratagene) in the EcoRI (5') and XhoI (3')
sites. pBluescript II SK- plasmids were excised from the
lambda Zap clones by superinfection with ExAssist
(Stratagene) phage. The library was normalized using
method 4 described in Bonaldo et al., (1996) Genome
Research 6: 791-806."

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster 10138.r

/notes="Organ: Brain; Vector: pYX-Asc; Site 1: EcoR I; Site 2: Not I; The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarose gel. First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is AGGAGACAG. This library was created for the University of Iowa Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D., program coordinator."

EST project with full-length enriched cDNA libraries carried out in Animal Genome Research Program (Japan) by National Institute of Agrobiological Sciences and STAFF-Institute  
Single pass sequencing of clones derived from oligo-capped cDNA library  
Vector sequences were eliminated by RepeatMasker version 2002/07/13 and crossmatch version 0.990319  
Low quality bases were trimmed based on the quality values.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using  
PT specific primers, and detecting the amplified nucleic acid.

XX Claim 1; Page 33; 44pp; English.

XX The invention relates to a method of detecting Mycobacterium species,  
CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA  
CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture  
CC comprising a polymerase, and at least two primers, and then detecting the  
CC amplified nucleic acid. The method is relatively simple and useful for  
CC detecting the presence of various Mycobacterium species in a biological  
CC sample, and thus important for diagnosis of infections resulting from  
CC them. The method is especially important for screening opportunistic  
CC infections caused by M. tuberculosis or a Mycobacterium other than  
CC tuberculosis (MOTT). The present sequence is a T7 promoter-primer used  
CC for amplifying Mycobacterium 16S rRNA. (Updated on 11-SEP-2003 to  
CC standardise OS field)

XX PT New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-  
 XX PT 1 and probes for detecting the amplified product are specific for gag and  
 XX PT pol regions and are useful to detect different subtypes of HIV-1.

XX PS Claim 1; Page 15; 37pp; English.

XX CC This invention relates to a series of nucleic acid oligomers for  
 XX CC amplifying and detecting a nucleotide sequence of human immunodeficiency  
 XX CC virus type 1 (HIV-1). The invention also comprises a labeled  
 XX CC oligonucleotide that specifically hybridizes to an HIV-1 sequence derived  
 XX CC from gag or pol sequences, having one of the sequences fully defined in  
 XX CC the specification, and a method for detecting HIV-1 in a biological  
 XX CC sample, comprising mixing the sample with two or more of the  
 XX CC amplification oligomers that specifically amplify at least one HIV-1  
 XX CC target sequence within gag and a pol sequence which is a protease or  
 XX CC reverse transcriptase sequence, amplifying the target, and detecting the  
 XX CC amplified product. The oligonucleotides of the invention may be used to  
 XX CC diagnose HIV-1 infection. The presents sequence represents a PCR primer  
 XX CC used to amplify the HIV-1 reverse transcriptase gene in the HIV detection  
 XX CC method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

XX Detecting Mycobacterium species, involves in vitro amplification of 16S
PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using
PT specific primers, and detecting the amplified nucleic acid.
XX Claim 1; Page 33; 44pp; English.
XX The invention relates to a method of detecting Mycobacterium species,
CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA
CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture
CC comprising a polymerase, and at least two primers, and then detecting the
CC amplified nucleic acid. The method is relatively simple and useful for
CC detecting the presence of various Mycobacterium species in a biological
CC sample, and thus important for diagnosis of infections resulting from
CC them. The method is especially important for screening opportunistic
CC infections caused by M. tuberculosis or a Mycobacterium other than
CC tuberculosis (MOTT). The present sequence is a T7 promoter-primer used
CC for amplifying Mycobacterium 16S rRNA. (Updated on 11-SEP-2003 to

PT New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-  
PT 1 and probes for detecting the amplified product are specific for gag and  
PT pol regions and are useful to detect different subtypes of HIV-1.  
XX  
PS Disclosure; Page 13; 37pp; English.

XX This invention relates to a series of nucleic acid oligomers for  
CC amplifying and detecting a nucleotide sequence of human immunodeficiency  
CC virus type 1 (HIV-1). The invention also comprises a labeled  
CC oligonucleotide that specifically hybridises to an HIV-1 sequence derived  
CC from gag or pol sequences, having one of the sequences fully defined in  
CC the specification, and a method for detecting HIV-1 in a biological  
CC sample, comprising mixing the sample with two or more of the  
CC amplification oligomers that specifically amplify at least one HIV-1  
CC target sequence within gag and a pol sequence which is a protease or  
CC reverse transcriptase sequence, amplifying the target, and detecting the  
CC amplified product. The oligonucleotides of the invention may be used to  
CC diagnose HIV-1 infection. The presents sequence represents a T7 promoter  
CC sequence used to produce transcripts from amplified target sequences  
CC produced using the oligonucleotide primers of the invention. (Updated on  
CC 29-AUG-2003 to standardise OS field)

PS
XX This invention relates to a series of nucleic acid oligomers for
CC amplifying and detecting a nucleotide sequence of human immunodeficiency
CC virus type 1 (HIV-1). The invention also comprises a labeled
CC oligonucleotide that specifically hybridizes to an HIV-1 sequence derived
CC from gag or pol sequences, having one of the sequences fully defined in
CC the specification, and a method for detecting HIV-1 in a biological
CC sample, comprising mixing the sample with two or more of the
CC amplification oligomers that specifically amplify at least one HIV-1
CC target sequence within gag and a pol sequence which is a protease or
CC reverse transcriptase sequence, amplifying the target, and detecting the
CC amplified product. The oligonucleotides of the invention may be used to
CC diagnose HIV-1 infection. The presents sequence represents a PCR primer
CC used to amplify the HIV-1 Gag gene in the HIV detection method of the
CC invention. (Updated on 29-AUG-2003 to standardise OS field)

XX
XX      Determining origin of an animal sample, useful e.g. for detecting
XX      adulteration of food, by testing hybridization of sample DNA with set of
XX      species-specific reagents.
XX
XX      Example 5; SEQ ID NO 241; 98pp; French.
XX
XX      The invention relates to a novel method for determining the animal
XX      species that is the origin of a sample. The method is very general, quick
XX      and easy to do. It can detect material from a species even when present
XX      in small amounts in presence of materials from several other species, and
XX      the species being tested do not have to be known a priori. DNA was
XX      isolated from an animal sample and amplified by PCR using two primers.
XX      The amplicon, containing a promoter for RNA T7 polymerase (present in one
XX      of the primers) was transcribed with incorporation of a fluorescent
XX      ribonucleotide, then transcripts cleaved to fragments of 20 nucleotides.
XX      These were tested for hybridisation to a DNA chip carrying 17-mer capture
XX      probes, specific for different animal species. The present sequence is
XX      used in the exemplification of the invention.

 XX Detecting prostate-specific antigen (PSA), prostate specific membrane  
 PT antigen (PSMA) or human kallikrein 2 (hk2) nucleic acids in samples using  
 PT probe molecules, useful for the diagnosis of prostate and breast cancers.  
 XX  
 XX Claim 1; Page 14; 77pp; English.  
 XX  
 CC The present invention is concerned with the detection of nucleic acid  
 CC markers for prostate and breast cancer, and PCR primers and probes which  
 CC are able to detect and quantify these markers. Prostate specific antigen  
 CC (PSA), prostate-specific membrane antigen (PSMA) and glandular kallikrein  
 CC -2 (hk2) have all been linked to prostate and breast cancers, and the  
 CC primers and probes of the invention are able to detect the abnormal  
 CC presence of mRNA expressed by their coding sequences in tissues other  
 CC than the prostate. This enables the presence of cancer to be perceived  
 CC and aids in the detection of metastases

 XX  
 XX Claim 1; Page 15; 37pp; English.  
 XX  
 CC This invention relates to a series of nucleic acid oligomers for  
 CC amplifying and detecting a nucleotide sequence of human immunodeficiency  
 CC virus type 1 (HIV-1). The invention also comprises a labeled  
 CC oligonucleotide that specifically hybridises to an HIV-1 sequence derived  
 CC from gag or pol sequences, having one of the sequences fully defined in  
 CC the specification, and a method for detecting HIV-1 in a biological  
 CC sample, comprising mixing the sample with two or more of the  
 CC amplification oligomers that specifically amplify at least one HIV-1  
 CC target sequence within gag and a pol sequence which is a processase or  
 CC reverse transcriptase sequence, amplifying the target, and detecting the  
 CC amplified product. The oligonucleotides of the invention may be used to  
 CC diagnose HIV-1 infection. The presents sequence represents a PCR primer  
 CC used to amplify the HIV-1 reverse transcriptase gene in the HIV detection  
 CC method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

Detecting Mycobacterium species, involves in vitro amplification of 16S
PT rRNA or DNA encoding RNA in nucleic acid amplification mixture using
PT specific primers, and detecting the amplified nucleic acid.
XX
PS Claim 1; Page 34; 44pp; English.
XX
The invention relates to a method of detecting Mycobacterium species,
CC that involves amplifying Mycobacterium 16S ribosomal RNA (rRNA) or DNA
CC encoding 16S rRNA in an in vitro nucleic acid amplification mixture
CC comprising a polymerase, and at least two primers, and then detecting the
CC amplified nucleic acid. The method is relatively simple and useful for
CC detecting the presence of various Mycobacterium species in a biological
CC sample, and thus important for diagnosis of infections resulting from
CC them. The method is especially important for screening opportunistic
CC infections caused by M. tuberculosis or a Mycobacterium other than
CC tuberculosis (MOTT). The present sequence is a T7 promoter-primer used
CC for amplifying Mycobacterium 16S rRNA. (Updated on 11-SEP-2003 to
CC standardise OS field)

XX
PS Claim 1; Page 26; 37pp; English.
XX
CC This invention relates to a series of nucleic acid oligomers for
CC amplifying and detecting a nucleotide sequence of human immunodeficiency
CC virus type 1 (HIV-1). The invention also comprises a labeled
CC oligonucleotide that specifically hybridises to an HIV-1 sequence derived
CC from gag or pol sequences, having one of the sequences fully defined in
CC the specification, and a method for detecting HIV-1 in a biological
CC sample, comprising mixing the sample with two or more of the
CC amplification oligomers that specifically amplify at least one HIV-1
CC target sequence within gag and a pol sequence which is a protease or
CC reverse transcriptase sequence, amplifying the target, and detecting the
CC amplified product. The oligonucleotides of the invention may be used to
CC diagnose HIV-1 infection. The presents sequence represents a PCR primer
CC used to amplify the HIV-1 reverse transcriptase gene in the HIV detection
CC method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

XX New nucleic acid oligomer for amplifying and detecting HIV-1 nucleotide
PT sequences and in providing information about the infective agent, e.g.
PT genetic subgroup or drug-resistance phenotype based on detectable
PT sequence information.
XX
PS Claim 1; SEQ ID NO 35; 39pp; English.
XX
CC The present invention relates to a nucleic acid oligomer for amplifying a
CC nucleotide sequence of human immune deficiency virus (HIV)-1. The
CC invention is useful in amplifying and detecting HIV-1 nucleic acid
CC sequences and in providing additional information about the infective
CC agent, such as its genetic subgroup or drug-resistance phenotype based on
CC detectable sequence information. The present sequence is HIV-1 gag1 gene
CC amplifying primer.

CC This invention relates to a series of nucleic acid oligomers for
CC amplifying and detecting a nucleotide sequence of human immunodeficiency
CC virus type 1 (HIV-1). The invention also comprises a labeled
CC oligonucleotide that specifically hybridizes to an HIV-1 sequence derived
CC from gag or pol sequences, having one of the sequences fully defined in
CC the specification, and a method for detecting HIV-1 in a biological
CC sample, comprising mixing the sample with two or more of the
CC amplification oligomers that specifically amplify at least one HIV-1
CC target sequence within gag and a pol sequence which is a protease or
CC reverse transcriptase sequence, amplifying the target, and detecting the
CC amplified product. The oligonucleotides of the invention may be used to
CC diagnose HIV-1 infection. The presents sequence represents a PCR primer
CC used to amplify the HIV-1 Gag gene in the HIV detection method of the
CC invention. (Updated on 29-AUG-2003 to standardise OS field)

PT Producing at least one control useful as negative controls or calibrators  
PT in a gene expression analysis system, comprises selecting inter- or  
PT intragenic region of genomic DNA from a known sequence to be amplified  
PT and cloned into a vector.  
XX Disclosure; Page 15; 47pp; English.  
XX The invention relates to a method for producing at least one control  
XX useful as negative controls or calibrators in a gene expression analysis  
XX system, which involves selecting inter- or intragenic region of genomic  
XX DNA from a known sequence to be amplified and cloned into a vector. The  
XX method is useful for producing controls useful in gene expression  
XX analysis systems and which can be tested to ensure lack of hybridisation  
XX with mRNA from sources other than the control DNA itself. The controls  
XX are useful as negative controls or calibrators in a gene expression  
XX analysis system or in a two-colour gene expression analysis system. The  
XX present sequence is a PCR primer used for amplifying yeast intergenic  
XX region (YIR). This sequence is used to illustrate the method of the  
XX invention

PT New nucleic acid oligomer for amplifying and detecting HIV-1 nucleotide
PT sequences and in providing information about the infective agent, e.g.
PT genetic subgroup or drug-resistance phenotype based on detectable
PT sequence information.
XX
PS Claim 1; SEQ ID NO 45; 39pp; English.
XX
CC The present invention relates to a nucleic acid oligomer for amplifying a
CC nucleotide sequence of human immune deficiency virus (HIV)-1. The
CC invention is useful in amplifying and detecting HIV-1 nucleic acid
CC sequences and in providing additional information about the infective
CC agent, such as its genetic subgroup or drug-resistance phenotype based on
CC detectable sequence information. The present sequence is HIV-1 pol4 gene
CC amplifying primer.

XX PT Detecting human immunodeficiency virus-2 nucleic acids in a sample, by  
 PT amplifying nucleic acids with oligonucleotides and detecting nucleic  
 PT acid, or hybridizing nucleic acid with a probe and detecting probe:target  
 PT duplex.

XX PS Claim 11; Page 25; 58pp; English.

XX CC The invention relates to a method of detecting human immunodeficiency  
 CC virus-2 nucleic acids (NA) in a biological sample, by contacting NAs with  
 CC 1st and 2nd amplification oligonucleotides, amplifying HIV-2 nucleotide  
 CC base sequence, and detecting the amplified NA; or providing a  
 CC hybridisation probe and detectable label, hybridising HIV-2 NA with the  
 CC probe to form probe:target duplex, and detecting the duplex. The method  
 CC is useful for detecting the presence of HIV-2 NAs in a lysate or a blood  
 CC product such as plasma or serum, and also for detecting subtypes A, B, C  
 CC and D of HIV-2. The method is useful for amplifying and detecting the NA  
 CC in blood serum and also as components of multiplex amplification  
 CC reactions that synthesise amplicons corresponding to polynucleotides of  
 CC unrelated viruses, e.g. HIV-1, hepatitis B virus (HBV) and hepatitis C  
 CC virus (HCV). ABK93895 represent HIV-2 detection probes of the  
 CC invention. (Updated on 29-AUG-2003 to standardise OS field)

XX PT New cell line transformed by a gene encoding an enzyme involved in drug  
 PT metabolism and by gene encoding an enzyme involved in ammonia metabolism,  
 PT useful in liver function supporting equipment for assessing liver  
 PT function.

XX PS Example 3; Page 11; 22pp; Japanese.

XX CC The invention relates to a novel cell line (HepG2) transformed by a gene  
 CC encoding an enzyme involved in drug metabolism, such as cytochrome P450  
 CC 3A4 (CYP3A4) and a gene encoding an enzyme involved in ammonia  
 CC metabolism, such as glutamine synthetase. The cell line of the invention  
 CC provides a hybrid artificial liver and facilitates cell procurement, and  
 CC thus may be useful in liver function studies. The current sequence is  
 CC that of the human glutamine synthetase (GS) DNA fragment of the invention  
 CC which was isolated from an expression vector.

XX Disclosure; Page 153-156; 156pp; English.  
PS The patent discloses methods and compositions to modulate the expression  
CC of a target gene in plant cells. The method involves providing plant  
CC cells with a zinc finger protein (ZFP) which is capable of specifically  
CC binding to a target nucleotide sequence or its complementary strand  
CC within a target gene and allowing the ZFP binding to the target  
CC nucleotide sequence, where the expression of the target gene in the plant  
CC cells is modulated. The ZFP and fusions of the ZFP proteins are useful  
CC for modulating or regulating gene expression and metabolic pathways in  
CC plants. The ZFP, fusion proteins and methods are useful in plant and  
CC agricultural technology. The method is useful particularly for treating a  
CC disorder in the plant cells, where the disorder is associated with  
CC abnormal expression of the target gene. The present sequence is six  
CC finger ZFP (2C7)-Sin3 interaction domain (SID) DNA

XX PT New peptide acting on a membrane of a microorganism, for preventing
XX PT putrefaction of food or industrial products and treating an infectious

```

PT disease, cancer, autoimmune disorders, inflammation and graft versus host  
 XX disease.

PS Example 6; SEQ ID NO 9; 58pp; English.

XX The invention relates to a peptide capable of specifically acting on a  
 CC membrane of a microorganism or an animal cell having an abnormality. The  
 CC peptide conforms to the formula given in claim 1 of the specification.  
 CC Exemplary sequences appear as ADMI1859-ADMI1965 (SEQ ID 110-113 and 119  
 CC are not indexed as being too short). Also included are a library  
 CC comprising nucleic acid sequences (each nucleic acid sequence comprising  
 CC (i) a first cassette comprising a base sequence encoding a first peptide,  
 CC (ii) a second cassette comprising a base sequence encoding a second  
 CC peptide, the base sequence having the same reading frame as that of the  
 CC base sequence encoding the first peptide, where the second peptide and  
 CC comprises a site allowing flexible movement of the first peptide and  
 CC (iii) a third cassette comprising a base sequence essentially required  
 CC for transcription and translation of the first and second cassette (e.g.  
 CC a T7 promoter), the third cassette being operatively linked to the first  
 CC and second cassette, where the number of the nucleic acid sequences in  
 CC the library whose first cassettes are different from another is at least  
 CC two), a vector comprising the library, a method for screening for a  
 CC nucleic acid encoding a peptide capable of acting on biological membrane,  
 CC a pharmaceutical composition for killing a microorganism (or preventing  
 CC putrefaction of food or industrial products, for treating an infectious  
 CC disease caused by a microorganism or a cancer and for suppressing  
 CC apoptosis), comprising the peptide, an antibiotic comprising the peptide,  
 CC a pharmaceutical delivery substance for delivering a drug to a site  
 CC infected with a microorganism (or to a cancer lesion site or to a site  
 CC undergoing apoptosis) comprising the peptide and a kit, for screening for  
 CC a nucleic acid encoding a peptide capable of acting on a biological  
 CC membrane. The peptides and compositions are useful in killing a  
 CC microorganism, preventing putrefaction of food or industrial products,  
 CC treating an infectious disease caused by a microorganism or a cancer,  
 CC e.g. bladder, stomach, breast, lung, prostate, large intestine, uterine,  
 CC ovarian or kidney cancer, glioblastoma, leukaemia, autoimmune disorders,  
 CC viral infections, inflammation and graft versus host disease and in  
 CC suppressing apoptosis. The present sequence is an RT-PCR (reverse  
 CC transcriptase PCR) primer used to recover mRNA expressing a membrane  
 CC interacting peptide of the invention.

PT Method of identifying polypeptide binding target molecules - uses an in  
 CC vitro translation system with formation of polysomes.

XX Example 8; Page 27; 47pp; English.

XX A method has been developed of identifying a nucleic acid encoding a  
 CC (poly)peptide that interacts with a target molecule. The method  
 CC comprises: (i) translating a population of mRNA molecules lacking stop  
 CC codons, in the correct reading frame in an in vitro translation system,  
 CC where the system either comprises antisense oligonucleotides  
 CC complementary to the tag-coding sequence of ssrA-RNA or is free of ssrA-  
 CC RNA so that formation of polysomes is allowed; (ii) contacting the formed  
 CC polysomes with the target molecules so that the nascent (poly)peptide  
 CC encoded by the RNA and produced by the polysome, binds the target  
 CC molecule; (iii) separating polysomes where the nascent (poly)peptide  
 CC produced by the polysome is bound to the target molecule from those  
 CC polysomes not displaying novel (poly)peptides; and (iv) identifying the  
 CC nucleic acid sequence encoding the (poly)peptide binding the target  
 CC molecule. Optionally prior to the formation of polysomes, DNA molecules  
 CC devoid of stop codons are transcribed in the presence of a reducing  
 CC agent, either beta-mercaptoethanol or DTT, to produce the corresponding  
 CC RNA molecules, and the reducing agent is then removed from the RNA  
 CC molecule. The method is used to identify polypeptides that bind target  
 CC molecules. The present sequence represents a PCR primer used in an  
 CC example from the present invention for construction of a polysome display  
 CC library

XX
XX Producing linear DNA fragments for the in vitro expression of proteins,
PT comprises amplifying a linear DNA fragment containing control elements
PT and a protein-coding gene having two ends with complementary regions to
PT the linear DNA fragment.
XX
XX Example 1; Page 6; 26pp; English.
XX
XX The present invention relates to a method for producing linear DNA
CC fragments for the in vitro expression of proteins. The method comprises
CC amplifying a linear DNA fragment, which contains control elements and a
CC protein-coding gene having two ends with complementary regions to the two
CC ends of the linear DNA fragment, using a primer pair that binds upstream
CC and downstream of the expression control region on the linear DNA
CC fragment. The method is useful for producing a linear DNA fragment for
CC the in vitro expression of proteins. The linear DNA fragment is
CC particularly useful for the in vitro expression of a protein using a
CC lysate from bacterial strains or eukaryotic cells. The present sequence
CC is a PCR primer, which was used in an example from the invention

XX
XX Displaying/selecting protease molecule, by incubating mRNA to enable its
PT translation to form complexes of ribosome, mRNA and encoded nascent
PT peptide, contacting complexes with protease binding ligand, selecting
PT complexes bound to ligand.
XX
XX Example 2; Page 41; 72pp; English.
XX
XX The specification describes a method for displaying and selecting
CC protease molecules. The method comprises incubating mRNA molecules
CC encoding a peptide under conditions suitable for translation of mRNA
CC molecules to form complexes comprising ribosome, mRNA and encoded nascent
CC peptide displayed on ribosome; contacting complexes with a protease
CC binding ligand; and selecting complexes which specifically bind protease
CC
CC binding ligand. The method is useful for displaying and selecting a
CC protease molecule; identifying one or more protease from a tissue sample;
CC identifying a protease with particular substrate specificity; identifying
CC protease binding ligand; displaying, characterizing and/or identifying
CC protease and modulators of protease activity; identifying new proteases
CC from library of peptides; and characterizing one or more tissues or
CC groups of tissues with respect to protease activity. The present PCR
CC primer was used to add the T7 promoter to mRNA constructs for display of
CC cathepsin S.

XX
XX Identifying an open reading frame encoding toxic protein, involves
PT detecting gap in map of shotgun clones from shotgun library aligned on
PT target DNA sequence, corresponding to numerical deficiency in start sites
PT of shotgun clones.
XX
XX Example 1; SEQ ID NO 3; 34pp; English.
XX
XX This invention describes a novel method for identifying an open reading
CC frame encoding a toxic protein, which involves obtaining an in silico map
CC of several shotgun clones from a shotgun library aligned on target DNA
CC sequence, detecting a gap in the map corresponding to numerical
CC deficiency at the start sites of shotgun clones in a region such that
CC there is a statistically underrepresented number of clones spanning the
CC ORF, and determining whether the product of the ORF is a toxic protein.
CC The target DNA fragment is a genome chosen from a bacterial genome,
CC archaeal genome and viral genome. The toxic gene is mapped to an ORF
CC adjacent to a methylase. The step of identifying the gene expressing the
CC toxic protein from the ORF further involves expressing the ORF in vivo or
CC by in vitro translation. The method is useful for identifying ORF's
CC encoding toxic proteins e.g. restriction endonucleases and enables
CC efficient characterization of toxic genes. This sequence represents a T7
CC universal primer used with AEE96337 to identify the Methylococcus
CC capsulatus Mcal617 restriction endonuclease using the method of the
```

XX DR Expression vector library, especially a phage display library comprises
XX PT several nucleic acid sequences whose expression is under regulatory
XX PT control of T7 promoter and encode antibodies or their fragments.
XX PS Claim 4; Page 43; 54pp; English.
XX CC The present sequence is a T7 promoter sequence preferred for use in
XX CC claimed expression vector libraries of the invention. These expression
XX CC vector libraries, preferably phage display libraries, comprise nucleic
XX CC acid sequences whose expression is under the regulatory control of a T7
XX CC promoter, and which encode antibodies or antibody fragments. The strong
XX CC repression of the T7 promoter increases the possibility of finding larger
XX CC variability in the pool of antibody fragments due to the low frequency of
XX CC deletion of undesirable, to the bacterial host, gene fragments. The high
XX CC efficiency of T7 RNA polymerase allows induction, by infection, at late
XX CC stages of the cell cycle, increasing the number of host cells and
XX CC limiting unwanted effects on the bacterial cells. (Updated on 29-AUG-2003
XX CC to standardise OS field)

XX DR Screening proteins or polypeptides by generating a gene library and
XX PT synthesizing proteins - useful for direct selection of a biological
XX PT phenotype.
XX PS Example 10; Page 69; 118pp; English.
XX CC This sequence corresponds to a PCR primer used to amplify a capture
XX CC domain sequence used in a method of screening proteins or polypeptides,
XX CC involving the generation of a gene library and the synthesis of proteins.
XX CC The methods permit direct selection of a biological phenotype, involving
XX CC contacting displayed proteins or polypeptides with target cells to enable
XX CC binding to the cell. The resulting alteration in the target cell permits
XX CC isolation of the cell and recovery of genes encoding the displayed
XX CC protein or polypeptide. Binding also results in the production or
XX CC cessation of production of molecules from the target cell, which also
XX CC permits the recovery of genes encoding the displayed protein or
XX CC polypeptide. Molecules produced are needed for cell survival when the
XX CC cell is a microorganism (especially a bacteria or bacteriophage). Release
XX CC of a molecule is needed for release of other molecules from liposomes.
XX CC Alteration also results in appearance or disappearance of a cell surface
XX CC marker on a cell

XX
XX In vitro peptide and antibody display libraries for identifying multiple
XX binding specificities of single chain antibodies.
XX
XX Example 1; Col 46; 50pp; English.
XX
XX The specification describes a method for generating libraries of
XX polysomes displaying nascent peptides suitable for affinity interaction
XX screening. The method can be used to identify multiple binding
XX specificities of single chain antibodies, and comprises contacting
XX antigens with a polysome library displaying nascent peptides having a
XX single chain antibody segment, separating polysomes bound to the antigen
XX species from polysomes not bound to the antigen species, and synthesizing
XX cDNA from the separated bound polysomes to identify single chain
XX antibodies which bind to at least one of the antigen species present. The
XX method for generating libraries of polysomes displaying nascent peptides
XX is useful for affinity interaction screening. PCR primers AAX85760-61
XX were used in the course of the invention

XX New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-
PT 1 and probes for detecting the amplified product are specific for gag and
PT pol regions and are useful to detect different subtypes of HIV-1.
XX
XX Claim 1; Page 26; 37pp; English.
XX
XX This invention relates to a series of nucleic acid oligomers for
XX amplifying and detecting a nucleotide sequence of human immunodeficiency
XX virus type 1 (HIV-1). The invention also comprises a labeled
XX oligonucleotide that specifically hybridizes to an HIV-1 sequence derived
XX from gag or pol sequences, having one of the sequences fully defined in
XX the specification, and a method for detecting HIV-1 in a biological
XX sample, comprising mixing the sample with two or more of the
XX amplification oligomers that specifically amplify at least one HIV-1
XX target sequence within gag and a pol sequence which is a protease or
XX reverse transcriptase sequence, amplifying the target, and detecting the
XX amplified product. The oligonucleotides of the invention may be used to
XX diagnose HIV-1 infection. The presents sequence represents a PCR primer
XX used to amplify the HIV-1 reverse transcriptase gene in the HIV detection
XX method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

 XX Novel transgenic plants expressing therapeutically active proteins form  
 PT their plastid genome, useful for producing allergens for vaccines.  
 XX PS Example 30; Page 58; 99pp; English.

CC The present invention describes plants (I) comprising a DNA molecule (II)  
 CC encoding a protein that is therapeutically active when administered to a  
 CC host, in its plastid genome. The transgenic plants are used to express  
 CC therapeutically active proteins, such as antigens, allergens, and  
 CC autoantigens. The therapeutically active proteins are used to treat or  
 CC prevent diseases, e.g. allergies, autoimmune diseases or transplant  
 CC rejection. The invention allows the production of large and inexpensive  
 CC supplies of protein-based medications. The plants are able to express  
 CC large amounts of proteins in a cost effective manner, and, as the  
 CC proteins are packaged in plastids, they can be isolated easily. The  
 CC present sequence represents an oligonucleotide used in the construction  
 CC of plant plastids which express the human BPI gene, which is used in an  
 CC example from the present invention. (Updated on 06-AUG-2003 to correct OS  
 CC field.)

 PT Novel plant useful for treating or preventing allergy, comprising a DNA  
 PT molecule encoding a mature ragweed pollen allergen in its plastid genome  
 PT and capable of expressing the pollen allergen.

XX  
 PS Example 30; Page 59; 99pp; English.

XX  
 CC The invention relates to a transgenic plant comprising in its plastid  
 CC genome a DNA molecule encoding a mature ragweed pollen allergen, which is  
 CC capable of expressing the pollen allergen. The plant or plant matter  
 CC derived from the transgenic plant such as tobacco, tomato, soybean, rice  
 CC or maize is useful for treating or preventing an allergy. The plant is  
 CC also useful as a pharmaceutical and as a medical food. The plant is  
 CC useful for suppressing and reducing undesired immune response, and  
 CC production of an antigen for determination of immunological activity. The  
 CC plant is useful for treating and preventing bacterial, parasitic and  
 CC viral diseases, allergies, autoimmune diseases and transplantations. The  
 CC present sequence is an oligonucleotide used for constructing a chimeric

CC gene containing human BPI gene under control of a promoter element  
 CC responsive to the bacteriophage T7 RNA polymerase

XX New nucleic acid oligomer, useful for detecting selected regions of gag  
PT and pol genes of human immune deficiency virus, particularly for  
PT assessing drug resistance.  
XX  
PS Claim 1; Page 59; 82pp; English.  
XX  
XX The present invention provides a number of nucleic acid oligomers which  
CC can be used to amplify the gag and pol genes of human immunodeficiency  
CC virus type 1 (HIV-1). These are used to detect regions of the gag and pol  
CC genes, especially regions associated with drug resistance, and also for  
CC identifying genetic subtypes of the virus. The present sequence is an  
CC oligomer of the invention. (Updated on 29-AUG-2003 to standardise OS  
CC field)

 XX PT New nucleic acid oligomers for amplifying a nucleotide sequence from HIV-  
 XX PT 1 and probes for detecting the amplified product are specific for gag and  
 XX PT pol regions and are useful to detect different subtypes of HIV-1.  
 XX PS Claim 1; Page 26; 37pp; English.  
 XX CC This invention relates to a series of nucleic acid oligomers for  
 XX CC amplifying and detecting a nucleotide sequence of human immunodeficiency  
 XX CC virus type 1 (HIV-1). The invention also comprises a labeled  
 XX CC oligonucleotide that specifically hybridizes to an HIV-1 sequence derived

CC from gag or pol sequences, having one of the sequences fully defined in  
 CC the specification, and a method for detecting HIV-1 in a biological  
 CC sample, comprising mixing the sample with two or more of the  
 CC amplification oligomers that specifically amplify at least one HIV-1  
 CC target sequence within gag and a pol sequence which is a protease or  
 CC reverse transcriptase sequence, amplifying the target, and detecting the  
 CC amplified product. The oligonucleotides of the invention may be used to  
 CC diagnose HIV-1 infection. The presents sequence represents a PCR primer  
 CC used to amplify the HIV-1 reverse transcriptase gene in the HIV detection  
 CC method of the invention. (Updated on 29-AUG-2003 to standardise OS field)

 PT Novel transgenic plants expressing therapeutically active proteins form  
 PT their plasmid genome, useful for producing allergens for vaccines.  
 XX  
 PS Example 30; Page 58; 99pp; English.  
 XX  
 CC The present invention describes plants (I) comprising a DNA molecule (II)  
 CC encoding a protein that is therapeutically active when administered to a  
 CC host, in its plasmid genome. The transgenic plants are used to express  
 CC therapeutically active proteins, such as antigens, allergens, and  
 CC autoantigens. The therapeutically active proteins are used to treat or  
 CC prevent diseases, e.g. allergies, autoimmune diseases or transplant  
 CC rejection. The invention allows the production of large and inexpensive  
 CC supplies of protein-based medications. The plants are able to express  
 CC large amounts of proteins in a cost effective manner, and, as the  
 CC proteins are packaged in plasmids, they can be isolated easily. The  
 CC present sequence represents an oligonucleotide used in the construction  
 CC of plant plasmids which express the human BPI gene, which is used in an  
 CC example from the present invention. (Updated on 06-AUG-2003 to correct OS  
 CC field.)

This sequence is the direct result of the Base calling software  
Phred (default parameters). It is the raw base calls. To aid in the  
identification of the high quality insert the software Lucy  
(default parameters) has been run on this sequence. Lucy identified  
the region [95,663].

This sequence is the direct result of the Base calling software  
Phred (default parameters). It is the raw base calls. To aid in the  
identification of the high quality insert the software Lucy  
(default parameters) has been run on this sequence. Lucy identified  
the region [102,627].

/notes="Organ: Root; Vector: pCMV.SPORT6; Root tissue from  
control, cold-acclimated and salt stressed wheat cultivar  
Norstar. 7 mRNA populations were combined before  
constructing the library; 7 day non-acclimated roots, 1,  
23, and 53 days cold-acclimated at 4C, and 30 minutes, 3  
hours and 6 hours treated roots with 200mM NaCl.  
Non-acclimated and cold-acclimated plants were grown in  
vermiculite while salt stressed plant were grown  
hydroponically. First strand synthesis in this library was  
done in the presence of methylated dCTP thereby protecting  
from internal cleavage with NotI."

The sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NotI site
and the oligo-dT track served to verify it as a clone from the
hippocampus tissue cDNA library preparation. M.B. Soares Lab Clone
distribution: Researchers may obtain BMAP cDNA clones from RESEARCH
GENETICS. It should be noted that Bento Soares is generating a
small number of additional specialized non-redundant arrays of BMAP
cDNAs whose availability will be considered under appropriate and
limited collaborative arrangements

RESULT 100
US-09-795-872-8
; Sequence 8, Application US/09795872
; Patent No. 6653068
; GENERAL INFORMATION:
; APPLICANT: Frisch, Christian
; APPLICANT: Kretschmar, Titus
; APPLICANT: Hoss, Adolf
; APPLICANT: Von Ruden, Thomas
; TITLE OF INVENTION: Generation of specific binding partners binding to (poly)peptides
; FILE REFERENCE: Morpho/10
; CURRENT APPLICATION NUMBER: US/09/795,872
; PRIOR FILING DATE: 2001-02-28
; PRIOR APPLICATION NUMBER: PCT/EP00/06137
; PRIOR FILING DATE: 2000-06-30
; PRIOR APPLICATION NUMBER: EP 99 11 2815.8
; PRIOR FILING DATE: 1999-07-02
; NUMBER OF SEQ ID NOS: 10
; SOFTWARE: PatentIn version 3.0
; SEQ ID NO 8
; LENGTH: 2869
; TYPE: DNA
; ORGANISM: artificial sequence
; FEATURE:
; NAME/KEY: misc.feature
; LOCATION: (1)..(2869)
; OTHER INFORMATION: synthetic construct
; OTHER INFORMATION: expression vector

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

RESULT 79  
DQ136108 474 bp DNA linear BCT 20-NOV-2004  
LOCUS  
DEFINITION Mycobacterium sp. 6BR15 16S ribosomal RNA gene, partial sequence.  
ACCESSION AY792024

VERSION AY792024.1 GI:55740323  
KEYWORDS  
SOURCE Mycobacterium sp. 6BR15  
ORGANISM Mycobacterium sp. 6BR15  
Bacteria; Actinobacteria; Actinobacteridae; Actinomycetales; Corynebacterineae; Mycobacteriaceae; Mycobacterium.  
REFERENCE  
1 (bases 1 to 474)  
Sarro, M.I., Garcia, A.M., Moreno, D.A. and Montero, F.  
AUTHORS Bioremediation of radioactive water with metallic materials  
TITLE Unpublished  
JOURNAL  
REFERENCE 2 (bases 1 to 474)  
Sarro, M.I., Garcia, A.M., Moreno, D.A. and Montero, F.  
AUTHORS Direct Submission  
TITLE Submitted (25-OCT-2004) Dep Ingenieria y Ciencia de los Materiales, Escuela Tecnica Superior de Ingenieros Industriales, Universidad Politecnica de Madrid, Jose Gutierrez Abascal, 2, Madrid, Madrid 28006, Spain
